1.0 INTRODUCTION

Tetra Tech NUS, Inc. (TtNUS) was commissioned by the U.S. Army Corps of Engineers (USACE) Fort Worth District, to conduct a Groundwater Investigation at the Eastern Landfill at Fort Wingate Depot Activity (FWDA), Gallup, New Mexico. Figure 1.0-1 depicts the location of FWDA. Figure 1.0-2 depicts the location of the Eastern Landfill site.

This Groundwater Investigation Report (GIR) has been prepared by TtNUS for the USACE Fort Worth District, under Contract No. DACA63-97-D-0030, Task Order No. 024 in accordance with USACE's Detailed Statement of Work (SOW) dated September 21, 2001 (revised July 23, 2003), work plan developed by TtNUS (Work Plan, Groundwater Investigation, Eastern Landfill, Fort Wingate Depot Activity, New Mexico, January 2004), and/or other guidance provided by the Fort Worth District Technical Manager.

1.1 Project Overview

The Groundwater Investigation activities described in this report focus on the Eastern Landfill of FWDA, as shown on Figure 1.0-2.

1.1.1 General

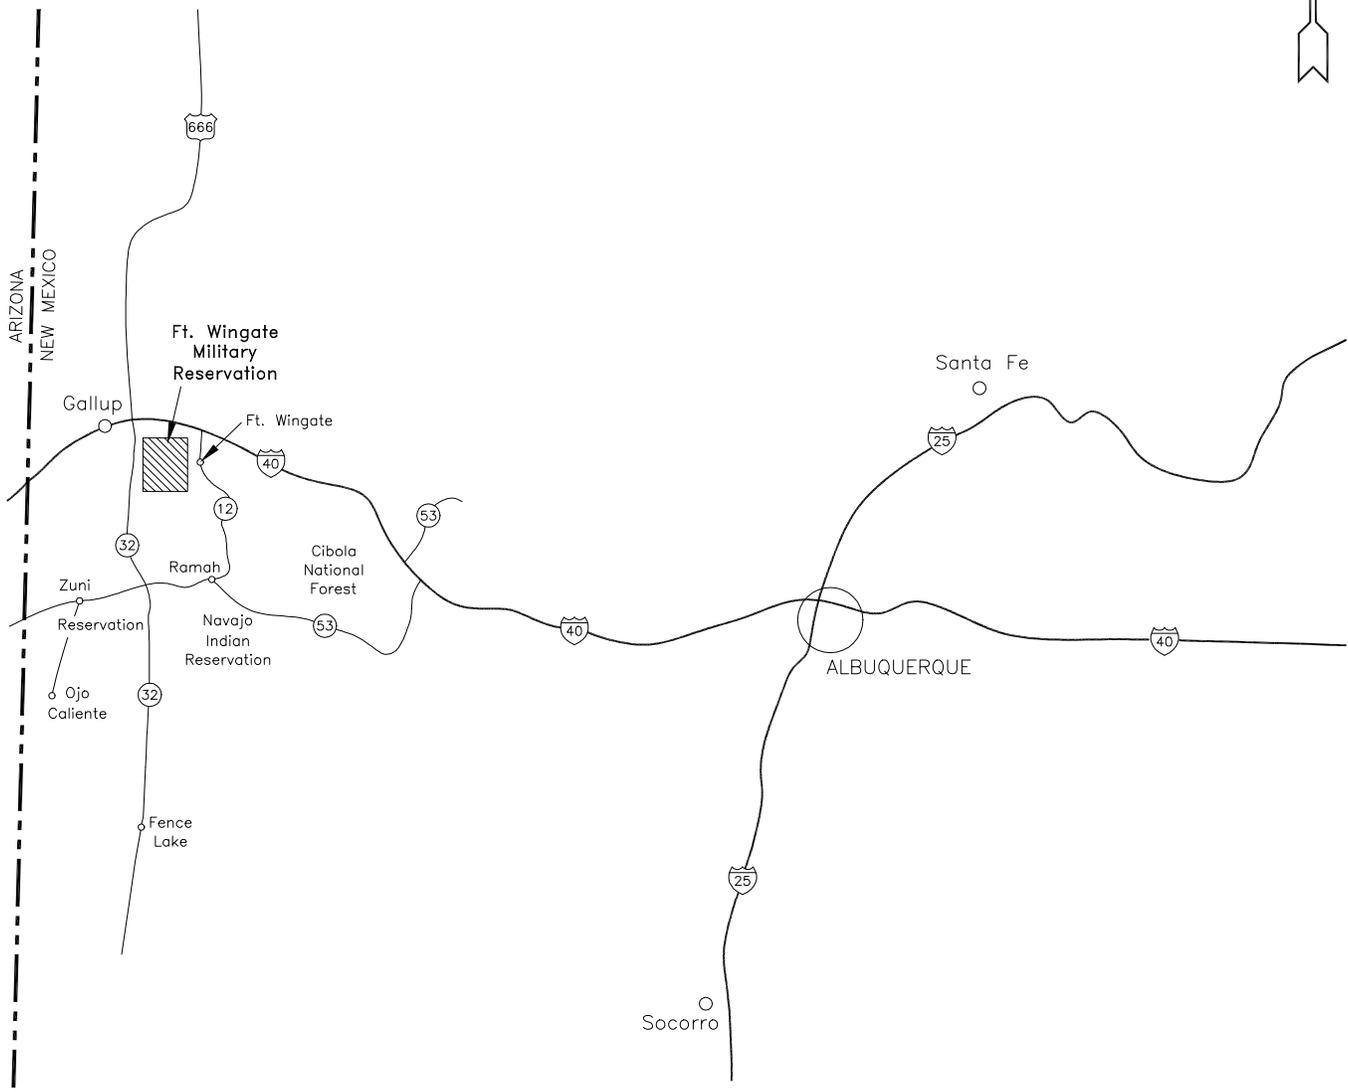

The Eastern Landfill is located approximately one half-mile northeast of the water towers, as shown on Figure 1.0-2. The landfill is reported to have been used for the disposal of garbage, trash, and debris from the Administration Area and for the burning of other solid waste from FWDA. In 1968, the landfill was closed and covered with a layer of soil.

1.1.2 Purpose of the Groundwater Investigation

The primary objective of the Groundwater Investigation was to determine if contaminants have impacted the groundwater beneath the Eastern Landfill at the FWDA.

1.2 Report Overview

The purpose of this GIR is to present the results of the groundwater investigation activities that TtNUS conducted at the Eastern Landfill at FWDA in July 2004.

This report is organized as follows:

- Section 1.0 – **Introduction**, provides a project overview.
- Section 2.0 – **Project Background**, presents a summary of the site background and history.
- Section 3.0 – **Field Operations**, presents a summary of the field investigation activities conducted by TtNUS as part of the groundwater investigation.
- Section 4.0 – **Quality Assurance/Quality Control**, discusses the quality assurance (QA) and quality control (QC) procedures that were effected during the groundwater investigation field activities to ensure the quality of the data.
- Section 5.0 – **Groundwater Investigation Results**, discusses the presence and character of identified contaminants at the Eastern Landfill.
- Section 6.0 – **Conclusions and Recommendations**, provides a summary of the conclusions and recommendations resulting from the groundwater investigation at the Eastern Landfill.

2.0 PROJECT BACKGROUND

The following sections provide a brief description of the background of FWDA and the Eastern Landfill along with a summary of the work completed at the Eastern Landfill.

2.1 FWDA Background

FWDA is an inactive U.S. Army depot whose former mission was to store, ship, and receive material and to dispose of obsolete or deteriorated explosives and ammunition. The active mission of FWDA ceased and the installation was closed in January 1993 as a result of the Defense Authorization Amendments and Base Realignment and Closure Act (BRAC) of 1988. Currently, the installation is undergoing final environmental restoration prior to property transfer/reuse.

FWDA is located in McKinley County in northwestern New Mexico, approximately 130 miles west of Albuquerque. The town of Gallup is located approximately 8 miles west of FWDA. FWDA covers approximately 34 square miles (22,120 acres). FWDA is almost entirely surrounded by federally owned or administered lands including both national forest and tribal lands. FWDA is divided into several areas which are defined by location and historical land use. These areas include: the Administrative Area, the Workshop Area, the Magazine Igloo Area, Open Burning and Detonation Area, and the Southern Properties.

2.2 Eastern Landfill Background

The Eastern Landfill is located approximately one half-mile northeast of the water towers, as shown on Figure 1.0-2. The landfill is reported to have been used for the disposal of garbage, trash, and debris from the Administration Area and for the burning of other solid waste from FWDA. In 1968, the landfill was closed and covered with a layer of soil.

As part of the Remedial Investigation (RI) conducted at FWDA by Program Management Corporation (PMC), an investigation of the Eastern Landfill was conducted. The RI results were documented in the “Final Remedial Investigation/Feasibility Study Report & RCRA Corrective Action Program” document dated November 15, 1997. During the RI, the Eastern Landfill was located and a geophysical survey was conducted. The results of soil sampling indicated that lead, mercury, and barium were present at levels slightly above background. The results of a soil gas survey indicated that low levels of methane were present. Hydrogen sulfide was not detected. Pesticides, volatile organic compounds and semi-volatile organic compounds also were not detected.

In October 1999, Safe Environment, Inc. removed surface debris in the area of the Eastern Landfill. The material removed consisted of metal ammunitions lids, wire rope, I-beams, pipe, tires, wire fencing, concrete blocks, expended ammunition casings, scrap wood, and tree branches/trunks.

In November 2000, TtNUS performed a site investigation to locate and define the lateral boundaries of the Eastern Landfill. The results are documented in the report entitled “Eastern Landfill Delineation Release Assessment Project” (TtNUS, November 2000).

The area was investigated using surface geophysical methodology (i.e., electromagnetic and magnetic). The geophysical results identified 10 anomalies, which required further investigation by visual or physical means. Ten locations were excavated, and the results confirmed the presence of landfill material in four out of ten anomalies.

The physical identification of the edge of the landfill was matched with geophysical anomalies and from the results identified that the Eastern Landfill consisted of several trenches or cells. The Eastern Landfill cells were identified along with other collections of burned material and debris. These results indicate that the Eastern Landfill consists of three trenches that are oriented parallel to one another and three areas of surface debris. A topographic survey was conducted at this area. The topographic survey consisted of a one-foot contour map over the area encompassing the Eastern Landfill cells.

3.0 FIELD OPERATIONS

The following subsections provide a detailed discussion of field operations that were performed during the course of the Groundwater Investigation conducted at the Eastern Landfill.

3.1 General Description and Information

The purpose of the Groundwater Investigation was to determine if contaminants of concern (COCs) have been released to the groundwater beneath the Eastern Landfill at FWDA.

The following groundwater investigation activities were performed at the Eastern Landfill at FWDA:

- Four groundwater monitor wells were installed;
- Groundwater samples were collected from two of the monitor wells to determine if impacts to groundwater are present;
- Aquifer testing (slug tests) was conducted on two of the monitor wells installed; and
- Groundwater elevation data was collected from nine existing monitor wells at FWDA.

3.2 Soil Boring Program

Four soil borings (EMW01 through EMW04) were drilled during the Groundwater Investigation at the Eastern Landfill to obtain lithologic data. Figure 3.2-1 depicts the locations of the soil borings. The soil borings were located as discussed in Section 3.2.1. Installation procedures for soil borings are discussed in Section 3.2.2.

The soil boring installations were carried out by using a hollow-stem auger drilling rig that was equipped with air rotary capabilities. Air rotary drilling techniques were used when hollow stem auger refusal (i.e., bedrock) was reached prior to the first shallow water-bearing zone. The boreholes were advanced to the first shallow water-bearing unit or to a maximum depth of 120 feet below ground surface (bgs), whichever came first.

According to the work plan, the soil borings were to be drilled to total depth and left open for 24 hours to determine if water was present. If water was present, the borings would be converted into monitor wells. If water was not present, the borings would be plugged and abandoned. During field activities, the USACE directed that all soil borings be converted to monitor wells.

3.2.1 Soil Boring Locations

The locations of the borings completed at Eastern Landfill are shown on Figure 3.2-1. The boring locations were selected by the USACE. The boring locations were situated so that one

boring (EMW01) was established immediately upgradient to the Eastern Landfill. The remaining three hydraulically downgradient locations were established along the perimeter of the landfill. The placement of “upgradient” and “downgradient” borings was based on the general surface topography as sufficient hydrogeologic information for this area did not exist to allow for the determination of groundwater flow direction. Following finalization of the work plan, the USACE requested that the location of EMW04 be moved to the south, closer to the Eastern Landfill. It was thought that this boring, EMW04, in its original proposed location would not be representative of groundwater conditions at the Eastern Landfill. The soil boring locations were spotted in the field by surveying using coordinates supplied by the USACE.

3.2.2 Installation of Soil Borings

All soil borings were drilled using a CME-75 drilling rig capable of using hollow-stem auger drilling techniques and air rotary techniques.

Hollow stem auger drilling was conducted using 7 3/4-inch outside diameter (OD) by 3 3/4-inch inside diameter (ID) auger flights. Air rotary drilling was conducted using a 6-inch OD blade bit. An air compressor with a capacity for delivering 600 cubic feet per minute was utilized during air rotary drilling. Air flow was directed through a Hankison air filter/dryer to treat the air and remove oil and moisture prior to the introduction of the air into the borehole.

Each soil boring was drilled to the first water-bearing zone, or to a maximum depth of 120 feet bgs. Table 3.2.2-1 summarizes the total depth of each boring. The minimum borehole diameter was 6 inches.

Table 3.2.2-1

SOIL BORING SUMMARY

Groundwater Investigation – Eastern Landfill Fort Wingate Depot Activity, Gallup, New Mexico

Soil Boring Number	Total Depth (feet bgs)	Drilling Method	Date Completed
EMW01	120	Hollow Stem Auger	07/14/04
EMW02	0 to 67.5 67.5 to 120	Hollow Stem Auger Air Rotary	07/19/04
EMW03	0 to 85 85 to 100	Hollow Stem Auger Air Rotary	07/21/04
EMW04	0 to 42 42 to 120	Hollow Stem Auger Air Rotary	07/23/04

Continuous sampling for lithology was conducted from ground surface until the total depth of each borehole was reached. Boreholes were continuously sampled for lithologic description while hollow stem auger drilling using a downhole sampling device (i.e., 5-ft CME sampler).

While air rotary drilling, lithologic descriptions were obtained from drill cuttings collected at the surface. Air rotary coring of rock was not conducted.

Hollow stem auger refusal was encountered in three of the soil borings (EMW02, EMW03 and EMW04) at depths of 67.5 feet bgs, 85 feet bgs and 42 feet bgs, respectively. Air rotary techniques were used to complete the drilling to total depth in these three borings.

Each boring was logged by an on-site geologist as it was being drilled. Completed field boring logs are included as Appendix A.

Soil cuttings generated during installation of soil borings were containerized and stored on-site pending subsequent disposal.

Collection of soil samples for laboratory analysis was not required for this project. According to the work plan, if first water was encountered in unconsolidated materials, then one soil sample (undisturbed) was to be collected from within the saturated portion of the screened interval of each well for geotechnical analysis. First water was not detected in unconsolidated material; therefore, no geotechnical samples were collected.

3.3 Groundwater Sampling

The following section pertains to the drilling and installation, construction and sample collection from monitor wells.

The locations of these groundwater samples are discussed in Section 3.3.1. Monitor well installation and construction are discussed in Section 3.3.2. Monitor well development is discussed in Section 3.3.3. The sampling methodology for groundwater sample collection is discussed in Section 3.3.4.

3.3.1 Groundwater Sample Locations

A total of four groundwater monitoring wells were drilled, installed and sampled in the vicinity of the Eastern Landfill, as shown in Figure 3.2-1.

Borings in which monitor wells were installed were advanced and documented using the procedures described in Section 3.2.2.

3.3.2 Monitor Well Installation and Construction

Monitor wells were constructed using new flush-threaded 2-inch diameter polyvinyl chloride (PVC) riser pipe and screen. The riser pipe was composed of Schedule 40 PVC. In each well, the screen consisted of 15-feet of flush-threaded Schedule 40 machine slotted PVC with 0.010-inch slots. No adhesives or solvents were used to join the threaded PVC sections. Teflon tape was used on the threaded joints to seal the joints.

Monitor well EMW01 was screened from 105 feet to 120 feet bgs. No obvious water was observed in the sediments while drilling EMW01. A sandy unit was encountered from 109 feet to 120 feet (total depth). Due to the lack of obvious water while drilling, this lower sandy unit was selected for screening.

Monitor well EMW02 was screened from 93 feet to 108 feet bgs. Air rotary drill cuttings exhibited signs of moisture (i.e., clumping) at approximately 103 feet bgs. Air rotary drilling continued to 120 ft with moist cuttings being brought to the surface. Once the drill bit was removed, the hole sloughed in approximately 12 feet. Therefore the bottom of the screen was set at 108 feet.

Monitor well EMW03 was screened from 78 feet to 93 feet bgs. At 80 feet bgs, the lithology exhibited a slight dampness to damp at 100 feet (total depth). Once the drill bit was removed, the hole sloughed in approximately 7 feet. Therefore the bottom of the screen was set at 93 feet.

Monitor well EMW04 was screened from 100 feet to 115 feet bgs. No obvious water was observed in the sediments while drilling EMW04. Due to the lack of obvious water while drilling, the lower most interval was selected for screening. Once the drill bit was removed, the hole sloughed in approximately 5 feet. Therefore the bottom of the screen was set at 115 feet.

The annular space surrounding each well screen was backfilled with a clean 20/40 silica sand filter pack. The sand filter pack extended from the bottom of the borehole to at least 3 feet above the top of the screen.

The annular space above the sand pack was backfilled with at least 3 feet of dry granular bentonite and allowed to hydrate sufficiently to prevent migration of grout into the sand pack. The annular area above the bentonite seal was backfilled with cement/bentonite grout emplaced via the tremie method from the top of the bentonite seal to the ground surface.

The PVC riser stickup equipped with a well cap was surrounded by a larger diameter protective steel casing rising approximately 24 to 36 inches above ground level and equipped with a locking cap and lock which was set into a concrete pad. Locks for all wells installed in the course of the work described herein were keyed alike. The protective steel casing contained no openings below its locking cap. The locks for the wells were delivered to Mr. Duke Davis, FWDA Caretaker, and the USACE.

A concrete pad measuring 4 feet by 4 feet by 6 inches thick was constructed around the protective steel casing at the final ground elevation, sloped slightly away from the well. Four 4-inch diameter protective steel posts were installed outside of the concrete surrounding the well pad and were filled with cement and painted with high visibility yellow paint. The well identification was marked onto the side of the protective casing.

Well construction diagrams were completed in the field for all monitor wells and are included as Appendix A.

During the construction of monitor well EMW02, a petroleum odor was noticed emanating from the borehole immediately after the placement of the bentonite chips into the annulus. The source of the petroleum odor was traced to the bentonite chips. It was discovered that a loose connection on a gasoline container located on the driller's work truck had allowed gasoline to spill on to one of the bags of bentonite chips stored on the work truck. Upon discovering this, the just installed well was immediately pulled from the borehole, the bentonite and sand pack were drilled out and the hole was then overdrilled with hollow stem augers to remove the bentonite. The hole was then plugged and abandoned with a cement/bentonite grout.

As a precaution, all the remaining bags of bentonite chips were removed from the site and replaced with new bags. For the remainder of the project, all bags of bentonite chips and sand filter pack were checked with a photoionization detector (PID) meter prior to their insertion into the borehole. No readings were detected with the PID on any of the bags of material used on the remaining wells.

The location for EMW02 was then moved 19 feet to the east, the borehole was redrilled and the monitor well was installed as described above.

Upon installation of the monitor wells, only two of the monitor wells (EMW02 and EMW03) contained water. The other monitor wells (EMW01 and EMW04) were initially dry upon completion.

3.3.3 Monitor Well Development

Monitor wells EMW02 and EMW03 were developed by pumping using an electric submersible pump. Monitor wells EMW01 and EMW04 were dry and thus were not developed. The work plan called for the removal of five saturated well volumes during the well development process. However, monitor wells EMW02 and EMW03 were initially pumped dry after 16 and 19 gallons were removed, respectively. In accordance with the work plan, the USACE was notified when the wells were pumped dry. The wells were allowed to recover overnight and one additional attempt was made to develop the wells. The wells were again pumped dry after removal of an additional 8 and 14 gallons, respectively. The turbidity of the formation water was recorded upon completion of the well development. Information collected during monitor well development was recorded on the Monitor Well Development Forms included as Appendix A.

Water generated during monitor well development was containerized and stored on-site pending subsequent disposal.

3.3.4 Sampling and Preservation Methodology for Chemical Analysis

Collection of groundwater samples for chemical analysis was performed using low flow/low stress groundwater sampling techniques.

Following well development activities described in Section 3.3.3, monitor wells EMW02 and EMW03 were allowed to stabilize overnight prior to commencement of groundwater sampling. Upon opening the cap of a monitor well for groundwater sampling purposes, a reading of the air

quality at the top of the well was measured using a PID; no volatile compounds were detected. The water level within the well was measured from a reference point on the PVC well casing of the well using a decontaminated electronic water level indicator. The possible presence of non-aqueous floating contaminants at the water surface was investigated using a hydrocarbon interface probe. Non-aqueous floating contaminants were not detected.

As the wells had been pumped dry during well development activities, sampling for chemical analysis was conducted as soon as the water level had recovered sufficiently to collect the appropriate volume needed for all the samples. A minimum of 750 milliliters (mL) was purged from each well prior to the filling of the sample containers to account for the bladder volume plus the extraction tubing volume. Samples were collected even though the indicator parameters had not stabilized.

A QED Sample Pro Bladder Pump (1.75-inch diameter) constructed of stainless steel with a Teflon bladder was used to collect the groundwater samples. The pump was placed within the lower 5 feet of the screen length within each monitor well. Low density polyethylene (LDPE) tubing was used for both the air line and groundwater discharge line of the bladder pump. Air for operation of the bladder pump was supplied using a QED Model 3020 12 Volt electric oil-less air compressor. The pump was started at the lowest setting and increased until discharge occurred. The pump speed was adjusted in an attempt to produce minimal drawdown. The flow rate was between 125 milliliters per minute (mL/min) to 200 mL/min. The flow rate did however exceed the recharge rate of the wells and the water level dropped continuously during the sampling process in both monitor wells.

Water samples were collected directly from the discharge tube into laboratory supplied containers. Samples for volatile organic analysis were collected prior to collection of other aliquots. Sample aliquots designated for semivolatile organics analysis were collected next, followed by the remaining sample aliquots. Filtered water samples for metals analyses were collected using the same low flow procedures. An in-line filter with an approximate pore size of 0.45 microns was used to collect the water sample. The filter was pre-rinsed with approximately 25 to 50 mL of groundwater prior to sample collection.

At the completion of sampling, field parameters (turbidity, temperature, specific conductance, pH, dissolved oxygen and oxidation reduction potential) were monitored and recorded using a Horiba U-22 water quality meter. Information collected during the groundwater sampling was recorded on the Groundwater Sample Log Sheets included as Appendix A.

Each member of the sampling crew donned a new pair of gloves at each sampling location. The person who actually collected the sample wore disposable latex gloves and changed them between each sample. Preservatives, where required, were placed into the sample containers at the analytical laboratory prior to transport of the sample containers to the site. Upon filling, sample containers were appropriately labeled, sealed in plastic "Ziplock" bags, and placed in an ice chest containing ice. The samples were packaged for shipment at the conclusion of each day's sample collection activities. Further details regarding sample management are provided in Section 4.0.

The analytical program for the groundwater samples collected during the Groundwater Investigation at the Eastern Landfill is discussed in Section 5.1.

Duplicate Groundwater Sample Collection

Field duplicate groundwater samples were divided into two portions at the time of sampling. The samples were prepared by alternately filling containers directly from the pump discharge tube. Sample aliquots designated for volatile organic analysis were collected first. Aliquots for semivolatile organic analysis were collected next, followed by aliquots pertaining to other analyses. Duplicate groundwater samples were submitted to the analytical laboratory for chemical analysis.

Triplicate Groundwater Sample Collection

Field triplicate groundwater samples were divided into three equal portions at the time of sampling. One portion was designated as the investigation sample, the second portion was a field duplicate, and the third portion was a triplicate. A triplicate sample was always collected along with a duplicate sample. Triplicate samples were collected in the same manner as duplicate samples were collected. Triplicate samples were forwarded directly to a separate laboratory under strict chain-of-custody procedures for chemical analysis.

3.4 Aquifer Testing

Monitor wells EMW02 and EMW03 were subjected to aquifer testing to determine aquifer characteristics. Monitor wells EMW01 and EMW04 were dry and thus were not subjected to aquifer testing. Slug tests (rising and falling head) were performed on monitor wells EMW02 and EMW03. An In-Situ MiniTroll downhole data logger was used to collect slug test data. The slug consisted of a solid PVC cylinder attached to a dedicated rope. The following is a description of the procedures utilized in the slug tests:

- The data logger pressure transducer probe was lowered into the well.
- The static water level in the well was measured to the nearest 0.01 foot using an electric water level meter with an audible alarm.
- The slug-in test commenced as the solid PVC slug of known volume was rapidly lowered into the well until the slug was fully submerged. The recording unit was activated just prior to the submersion of the slug.
- The change in height of the water column was recorded at logarithmic time intervals until the well reached equilibrium (in excess of 90 percent recovery) or the test had run for a minimum of 30 minutes.
- The data logger was then recalibrated for the slug-out test.
- The slug out test commenced with the rapid removal of the PVC slug. The recording unit was activated just prior to the removal of the slug.
- The change in height of the water column was recorded at logarithmic time intervals until the well reached equilibrium (in excess of 90 percent recovery) or the test had run for a minimum of 30 minutes.

Because of the slow recharge rate of the wells, none of the tests reached recovery equilibrium. The results of the slug testing activities at the Eastern Landfill are discussed in Section 5.4.

3.5 Groundwater Elevation Measurements

A groundwater elevation survey was conducted at nine existing monitor wells located at the Eastern Landfill, Work Shop, Administration and TNT Leaching Bed Areas. These monitor wells included TMW02, TMW05, TMW14A, TMW16, TMW17, TMW18, TMW19, FW35 and TMW28. A summary of the groundwater elevation measurements is presented in Section 5.3.

All water level measurements were obtained with an electronic water level monitor. Measurements were made relative to a notch or other permanent mark which serves as a consistent reference point. These measurements were accurate to 0.01 feet.

3.6 Field Measurements

Field parameters measured during the course of the Groundwater Investigation conducted at the Eastern Landfill were as follows:

- Volatile organics scanning of worker's breathing space and recovered soil and groundwater samples;
- pH, temperature, turbidity, dissolved oxygen, oxidation reduction potential and conductivity of water samples; and
- Personnel safety monitoring of Lower Explosive Limit (LEL), Oxygen (O₂), Hydrogen Sulfide (H₂S) and Carbon Monoxide (CO).

Volatile organics scanning was conducted using a Thermo Environmental Instruments Model 580S Organic Vapor Meter PID. Recovered soil samples were field scanned with a PID. All PID field-screening readings were recorded in the field logs. No positive PID readings were detected. There was no background PID reading.

Conductivity, pH, turbidity, dissolved oxygen, oxidation reduction potential and temperature were measured using a Horiba U-22 water quality meter.

Personnel safety monitoring was conducted using a RAE Systems, Inc. gas meter.

Instruments used to collect field data were identified with a unique identification number so that the instrument calibration and maintenance history can be traced. Each instrument was calibrated prior to its delivery to the field, daily or as required and supplied with fresh calibration standards.

The project field notebook or the project calibration logbook was used to document the calibration of field testing equipment. Documentation of calibration included the following:

- Date of calibration;
- Identification number of instrument being calibrated;

- Initials of the person performing the calibration; and
- Instrument readings versus standard value.

Equipment used by TtNUS was maintained in accordance with the manufacturer's instructions.

3.7 Field Documentation

Field documentation and tracking of sample custody are integral portions of the overall QA/QC process for the Groundwater Investigation. The field documentation system serves as a record of activities conducted in the field during sample collection and data generation and provides the means to identify, track, and monitor each sample from the time of collection through final reporting of data. All field documentation was completed in the field log book or data sheets (e.g., boring log forms, sampling sheets, etc.) using indelible ink. Procedures pertaining to sample custody and documentation employed during the Groundwater Investigation conducted at Eastern Landfill are discussed in Section 4.0.

3.7.1 Sample Identification

The sample identification scheme presented below was used to identify and label all field samples collected and all field QC blanks created during the Groundwater Investigation activities at the Eastern Landfill. The sample identification procedure was used for all sample labels and chain-of-custody documents in order to maintain consistency in the labeling process and to allow efficient handling of a large number of samples from different sources.

The sampling numbers were assigned as follows:

aa-bbbb-cccc-ddd

- **aa** - refers to the site location, where:
 - FW = Fort Wingate
- **bbbb** - describes the sample location and sequence number or QA/QC modifier, where:
 - EMW01 to EMW04 = Eastern Landfill sample locations
- **cccc** - describes the QA/QC modifier, where:
 - RNSW = Equipment Rinsate Blank
 - FLBK = Field Blank
 - DUP = Field Duplicate
 - FTRP = Field Triplicate
- **ddd** - indicates the depth of the sample, where applicable

In the case where a QA/QC modifier was used (i.e., RNSW or FLBK), the depth indicator was separately and sequentially incremented for each type of blank. The first equipment blank was labeled 001, the second 002, etc.

3.7.2 Field Log Books

The sampling coordinator maintained a field notebook and field data sheets containing pertinent information regarding the samples. The field logs are intended to provide sufficient data and observations to enable the field team and other interested parties to reconstruct events that occurred during field activities. The field notebook was a bound book with consecutively numbered pages. Entries in the field notebook and the associated field data sheets were made in indelible ink. A chronology of site activities is included as Appendix B.

3.7.3 Boring Logs and Well Construction Diagrams

Boring logs were maintained for the four soil borings identified in Section 3.2. Copies of the boring logs and well construction diagrams are included as Appendix A.

3.8 Land Surveying

Land surveying was conducted by a licensed surveyor to determine the horizontal and vertical locations (XYZ) location of all soil boring and monitoring well locations. Horizontal control was referenced to an existing datum (i.e., 1983 New Mexico West State Plane Coordinate System). Vertical control was referenced to the 1988 North American Vertical Datum.

Table 3.8-1 summarizes the horizontal and vertical locations of the monitor well. Monitor well locations are shown on Figure 3.2-1.

Table 3.8-1

SUMMARY OF SURVEY POINTS

**Groundwater Investigation – Eastern Landfill
Fort Wingate Depot Activity, New Mexico**

Boring Number	Northing	Easting	Top of Casing Elevation	Ground Elevation
EMW01	1643653.28	2502047.57	6717.61	6715.16
EMW02	1643388.64	2502478.93	6701.57	6699.14
EMW03	1643684.94	2502802.90	6700.21	6697.69
EMW04	1643812.62	2502421.78	6707.51	6704.84

Note:

Horizontal and vertical locations of all sample locations referenced to existing site datum (New Mexico West State Plane Coordinates, North American Datum 1983 and North American Vertical Datum 1988).

4.0 QUALITY ASSURANCE/QUALITY CONTROL

The objectives of the QA/QC program were to determine the quality of data (precision and bias) and to allow assessment of the quality of the data (variability).

4.1 Sample Management

The proper management of samples collected throughout the course of the Eastern Landfill Groundwater Investigation is discussed in the following subsections.

The following record keeping items were used to document sample collection and handling:

- Chain-of-custody records;
- Sample Data Sheets;
- Freight bills for samples shipped via an overnight carrier; and
- Analytical reports (electronic file and hard copy).

Samples collected during the course of the investigation were placed in appropriate laboratory-supplied, decontaminated sample containers, with the exception of water sample aliquots designated for pH/temperature/conductivity/dissolved oxygen/turbidity/oxidation reduction potential testing. These samples were placed directly into the sample analysis reservoir of the meter or into a previously unused laboratory-supplied, decontaminated glass sample container for testing.

The following guidelines and procedures pertaining to sample containers were effected throughout the course of the investigation:

- The analytical laboratory added the appropriate chemical preservatives to the sample containers prior to sample collection.
- After samples were collected, caps were screwed tightly onto the containers.
- Each member of the sampling crew donned a new pair of gloves at each sampling location. The person who collected the samples wore disposable latex gloves and changed them between collection of each sample.

4.1.1 Sample Custody

The following chain-of-custody procedures documented sample possession from the time of sample collection until ultimate disposal of the sample. For the purposes of these procedures, a sample was considered to be in custody if it was:

- In one's actual possession,
- In view after being in one's possession,

- Secured (i.e., locked up) so that no one could tamper with it, or
- In a secured area, available to authorized personnel only.

Strict chain-of-custody procedures were maintained throughout the duration of the investigation. These procedures included the following:

- A custody seal, which was an integral part of the custody process, was used to detect unauthorized tampering with shipping/sample containers. The seal was signed, dated, and affixed to the shipping container. After the custody seal was attached to the shipping container, the only access to the shipping container was by breaking the custody seal.
- A chain-of-custody record was completed in the field. The original accompanied the samples, and copies were maintained at intermediate steps.
- At every point where the responsibility for custody of the samples changed, the new custodian signed the chain-of-custody record and noted the date and time.

4.1.2 Sample Packaging and Shipping Procedures

The following guidelines and procedures pertaining to sample packaging and shipping were effected throughout the investigation:

- The samples were properly labeled and sealed.
- Sample containers were placed in previously unused polyethylene Ziplock bags to keep them dry during shipment to the analytical laboratory. Only one sample container was placed in each bag. As much air as possible was removed from the bag to conserve space within the shipping container.
- Sample containers were then placed in shipping coolers containing packing materials and ice.
- A temperature blank sample was placed in each shipping container amongst the sample containers.
- Several double-bagged and sealed Ziplock bags of ice were placed atop the sample containers.
- The completed and signed chain-of-custody form was placed within a Ziplock bag, and the bag was taped to the inside cover of the ice chest.
- The lid of the ice chest was closed and packing/strapping tape was wrapped around the ice chest on both ends and completely around the lid opening. The drain plug of the ice chest was taped shut securely.

- Custody seals were affixed to the ice chest, extending across the junction between the lid and the body of the ice chest, and were secured by placing clear packing/strapping tape over the custody seals and onto the exterior of the shipping container.
- Appropriate shipping labels were secured to the shipping container and the freight bill number was recorded within the field notebook.
- The shipping container(s) were delivered to an overnight carrier for shipment.

According to the cooler receipt forms completed at the laboratory upon receipt of samples, all samples arrived at the laboratory in good condition with custody seals intact.

4.2 Decontamination Procedures

Proper decontamination of field equipment was an integral part of the overall QA/QC process. A decontamination pad was constructed for heavy equipment. The dimensions of the pad were approximately 18 feet by 20 feet. The pad was lined with a 30-mil high-density polyethylene membrane liner. Wooden pallets were used at the decontamination pad to hold the equipment above ground to facilitate cleaning during decontamination activities. All decontamination liquids were collected from the decontamination pad and stored in a 330-gallon plastic tote container pending analyses prior to disposal.

The following subsections detail decontamination procedures that were effected throughout the duration of field activities associated with the investigation.

4.2.1 Drilling Equipment

Heavy equipment (e.g., hollow stem augers, etc.) were pressure washed at the designated decontamination area prior to commencement of operations, after completion of each boring, and upon the conclusion of intrusive operations.

4.2.2 Soil Sampling Equipment

Collection of soil samples for chemical analysis was not required for this project. However, sampling equipment (e.g., CME sampler, etc.) was decontaminated by pressure washing or through the following steps:

- Wash in solution of tap water and Alconox or equivalent;
- Tap water rinse;
- Double rinse with distilled water; and
- Air dry.

4.2.3 Field Measurement Equipment

Field measurement equipment that did not directly contact environmental media (i.e., PID) was maintained in a clean manner. Field measurement equipment that directly contacted environmental media (i.e., water quality meter or water level indicator) was rinsed with distilled water after each usage.

Prior to recording field measurements involving groundwater samples, the probes of the equipment were rinsed twice with aliquots of the groundwater sample.

4.2.4 Well Development and Groundwater Sampling Equipment

Well development and sampling equipment were decontaminated prior to insertion into the wells by the following steps:

- Wash in a solution of tap water and Alconox or equivalent;
- Tap water rinse;
- Double rinse with distilled water.

The wash and rinse solution was also pumped through the well development and sampling equipment. Dedicated LDPE tubing was used for the bladder pump at each well location. A new disposable bladder was also used for each well sampled.

4.3 Investigative Derived Waste (IDW) Management

The type of wastes generated as a result of the investigation activities at the Eastern Landfill were drill cuttings, purge water and decontamination liquids. All drill cuttings were collected at the individual boring locations and loaded into a roll-off bin located at the decontamination pad area. Purge water and decontamination liquids were collected and loaded into a 330-gallon plastic tote, also located at the decontamination area. All containers used to containerize waste were clearly identified and labeled "PENDING ANALYSIS".

One grab sample was collected from the roll-off bin containing solids and submitted to the laboratory for chemical analysis. One grab sample was also collected from the plastic tote containing liquids and submitted to the laboratory for chemical analysis. The solid and liquid IDW samples were analyzed for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), herbicides, explosives, metals, and reactivity, corrosivity and ignitability (RCI).

The roll-off bin and plastic totes were removed from FWDA by the IDW contractor, Rinchem, Inc., on August 3, 2004 and temporarily stored at their facility in Albuquerque, NM pending results of the waste profiling.

The solid waste was transported to and disposed of at the Rio Rancho Sanitary Landfill in Rio Rancho, New Mexico on October 15, 2004. The liquid waste was transported to and disposed of at the City of Albuquerque Public Works Wastewater Utility facility on August 25, 2004. Copies of the manifests for the disposal of the IDW materials are included as Appendix C.

4.4 Field QA/QC Sample Description

Field quality control measures included the collection and analysis of QA/QC samples. The QA/QC samples were collected during the sampling activities to assess the variability introduced in sampling, handling, shipping and analysis. Field QC samples included field blanks, equipment blanks, trip blanks and field duplicates. Field QA samples included field triplicates. The types and frequency of field QA/QC samples are described in the following subsections.

4.4.1 Field Blanks

Field blanks are samples of source water used for decontamination. In accordance with the work plan, one field blank was collected of water from the driller's water storage tank and one field blank was collected of water from the FWDA standpipe identified by the FWDA caretaker.

4.4.2 Trip Blanks

Trip blanks were fabricated in the analytical laboratory by pouring analyte-free reagent water into 40-mL Teflon-lined septum vials. They accompanied the sample containers into the field, but remained unopened until analyzed in the laboratory after being returned from the field. Trip blanks thus served to identify contamination of the samples or sample containers that might have occurred during transport of sample containers from the laboratory to the field and from the field to the laboratory.

One trip blank accompanied each sample container in which groundwater samples designated for VOC analysis were contained. Trip blanks were tested only for VOCs.

4.4.3 Equipment (Rinsate) Blanks

Equipment blanks samples are prepared in the field to assess the effectiveness of decontamination procedures applicable to groundwater sampling equipment. Equipment blanks were prepared by pouring analyte-free distilled water through the decontaminated sampling equipment and collecting the rinsate in appropriate clean sample containers.

Equipment blanks were collected at a rate of 10 percent, being defined as one equipment blank for every 10 or less samples per matrix. One equipment blank was collected at the Eastern Landfill.

4.4.4 Field Duplicates

Field duplicates are samples that are divided into two portions at the time of sampling. Field duplication provides precision information regarding homogeneity, handling, shipping, storing, preparation, and analysis. Field duplicates were collected at a frequency of one per every 10 or less samples per matrix.

One field duplicate groundwater sample was collected using methods described in Section 3.3.4 at the Eastern Landfill and submitted to the laboratory for chemical analysis.

4.4.5 Field Triplicates

Field triplicates are samples that are divided into three portions at the time of sampling. The purpose of a field triplicate was to allow for assessment of the laboratory data by an independent laboratory. One field triplicate groundwater sample was collected at the Eastern Landfill using methods described in Section 3.3.4 and forwarded to a separate quality assurance laboratory under strict chain-of-custody procedures described in Section 4.1.1.

4.4.6 Temperature Blanks

Temperature blanks, supplied by the analytical laboratories, were included in each cooler containing samples that were shipped to the laboratories, including the QA samples shipped to the QA laboratory.

4.5 Data Validation Results Summary

The objective of TtNUS data validation was to review laboratory analytical procedures and quality control results to verify the usability of data toward meeting project data quality objectives (DQOs) established in the Work Plan (January 2004). To validate the analytical data obtained as part of the Groundwater Investigation, the analytical test results (including laboratory QC data) for soil and water samples received from the testing laboratories were reviewed in accordance with “USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review” and “USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review”. The validation was conducted based on the Level III data package deliverables.

The data were evaluated based on accuracy, precision, representativeness, completeness, and sensitivity which measured the reproducibility of analytical results, the representativeness of site environmental conditions, and the consistency in the performance of the analytical methods. The sensitivity parameters, such as the method detection limits (MDL), sample quantitation limit (SQL), and reporting limit (RL) were approved by the USACE before the investigation. The SQL was defined as the MDL adjusted for sample-specific action such as dilution or use of varying sample aliquot sizes. The RL was set at the lowest standard used for the initial calibration curve for each target analyte. Target analyte values detected and reported below the RL were flagged as an estimated quantity (i.e., J-flag).

A total of one soil sample (IDW-Soils) and eight water samples (two investigation water samples, one

IDW-Water sample, one quality control water sample, one quality assurance water sample, two field blanks, and one equipment blank) were collected and analyzed. The following EPA SW-846 Methods and other EPA methods were used to analyze the samples:

- Method 6010B Inductively Coupled Plasma Atomic Emission Spectroscopy (Trace ICP) or Method 6020A (ICP/Mass Spectrometry (MS)) for metals in total and dissolved fractions;
- Method 7470A/7471A cold vapor for mercury in total and dissolved fractions;
- Method 8260B for volatile organics;
- Method 8270C for semi-volatile organics;
- Method 8151A for herbicides;
- Method 8081A for pesticides;
- Method 8141 for organophosphorus pesticides;
- Method 8082 for polychlorinated biphenyls (PCBs);
- Method 8082 for PCB congeners;
- Method 8290 for Dioxins/Furans;
- Method 8330 for explosives; and
- Wet Chemistry: pH (EPA 150.1); Total Dissolved (TDS, EPA 160.1); chloride, fluoride, sulfate, and nitrate as nitrogen (NO₃-N, EPA 300); nitrite as nitrogen (NO₂-N, EPA 353.2); sulfide (EPA 376.1); and Cyanide (SW846, 9012A).

Based on the results of this evaluation, validated data were qualified to alert the user of limitations. The following definitions provide brief explanations of the nationally used qualifiers assigned to results in the data review process:

- U** The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J** The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ** The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R** The sample results were rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria.

Narrative Report, Chain-of-Custody Record, Cooler Receipt/Sample Log-in Sheet, Run Logs, and data sheets including the quality control package and instrument analysis results were complete and contained the required information. The data meet the general requirements of the approved work plan for the site, and should be considered valid and acceptable.

A complete copy of the Data Usability Report for this investigation is included as Appendix D. The

electronic data deliverable is included in Appendix E. A summary of the analytical data with TtNUS data validation qualifiers and analytical laboratory qualifiers are provided as Appendix F.

5.0 GROUNDWATER INVESTIGATION RESULTS

5.1 Analytical Parameters and Methods

5.1.1 Soil Samples

Soil samples for chemical analysis were not collected during the Groundwater Investigation.

5.1.2 Groundwater Samples

Four (4) groundwater samples (2 investigation, 1 duplicate [QC] and 1 triplicate [QA]) were collected for chemical analysis as described in Section 3.3.4. Groundwater samples collected for chemical analysis were analyzed using the methods listed in Table 5.1.2-1. A list of site-specific constituents is presented in table 5.1.2-2.

Table 5.1.2-1

5.1.3 QA/QC Samples

QA/QC for samples collected during the Groundwater Investigation at the Eastern Landfill included the following:

- Field Blanks (see Section 4.4.1);
- Trip Blanks (see Section 4.4.2);
- Equipment blanks (see Section 4.4.3);
- Duplicates (see Section 4.4.4);
- Triplicates (see Section 4.4.5); and
- Temperature Blanks (see Section 4.4.6).

Trip blanks were analyzed for volatile organics only. QA/QC samples were analyzed for the full suite of parameters using the methods listed in Table 5.1.2-1.

5.2 Discussion of Analytical Results

The Groundwater Investigation conducted at the Eastern Landfill consisted of the installation of four monitor wells. Two groundwater samples were collected from two of the four monitor wells for chemical analysis. Groundwater samples were collected from monitor wells EMW02 and EMW03. Monitor wells EMW01 and EMW04 did not contain a sufficient amount of water for sampling.

The analytical data presented in this Groundwater Investigation Report were subjected to a data validation process performed by TtNUS personnel to ensure the integrity and defensibility of the data. The Data Validation Report is presented in Appendix D. A list of the data qualified by TtNUS personnel is included in Appendix F. Samples collected for chemical analysis during the Groundwater Investigation were analyzed by Severn Trent Laboratories of Houston, Texas. Quality assurance samples (triplicates) were analyzed by Datachem Laboratories of Salt Lake City, Utah.

For reporting purposes, all detected concentrations of analyzed groundwater samples are discussed in this section. Chemical analytical results discussed in this section are summarized in Table 5.2-1 for organic compounds and in Table 5.2-2 for metals. As discussed in the following subsections, analytical results were compared to EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003). It should be noted that not all compounds detected had corresponding screening levels.

5.2.1 Volatiles

Four volatile organics (acetone, toluene, xylene-totals, and methyl ethyl ketone) were detected above the reporting limits in the groundwater samples collected at the Eastern Landfill site. The compounds were all detected in samples collected from one location, monitor well EMW03. The concentrations detected are less than the respective EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for these compounds.

mg/L - milligrams per liter

5.2.2 Semivolatiles

Six semivolatile organics (acetophenone, butylbenzophthalate, 2-methylnaphthalene, bis(2-ethylhexyl)phthalate, naphthalene and phenol) were detected above the reporting limits in groundwater samples collected at the Eastern Landfill site. With the exception of one compound in one sample, the concentrations detected are less than the respective EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for these compounds.

The concentration of bis(2-ethylhexyl)phthalate in the duplicate sample collected from monitor well EMW03 (0.00682 mg/L) exceeds the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for bis(2-ethylhexyl)phthalate of 0.0048 mg/L.

5.2.3 Pesticides

Five pesticides (Dieldrin, Endosulfan II, Endrin Aldehyde, gamma-BHC and Heptachlor Epoxide) were detected above the reporting limits in one groundwater sample collected at the Eastern Landfill site. The concentrations of Dieldrin (0.0000139 mg/L) and Heptachlor Epoxide (0.0000587 mg/L) detected in the triplicate sample collected from monitor well EMW03 exceed the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for these compounds of 0.0000042 mg/L and 0.0000074 mg/L, respectively.

5.2.4 Polychlorinated Biphenyls and Congeners

One PCB congener (2-monochlorobiphenyl) was detected above the reporting limit in one groundwater sample collected at the Eastern Landfill site. An EPA Region 6 Human Health Medium-Specific Screening Level for Tap Water (Version 6, November 2003) for this compound is not available.

5.2.5 Herbicides

Herbicides were not detected above the reporting limits in the groundwater samples collected at the Eastern Landfill site.

5.2.6 Dioxins and Furans

Dioxins and Furans were not detected above the reporting limits in the groundwater samples collected at the Eastern Landfill site.

5.2.7 Explosives

Five explosives (RDX, nitrobenzene, 2,4,6-TNT, nitroglycerin and DNX) were detected above the reporting limits in groundwater samples collected at the Eastern Landfill site. The concentration of RDX (2.9 micrograms per liter [µg/L]) detected in one groundwater sample collected from monitor well EMW02 exceeds the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water

(Version 6, November 2003) for this compound of 0.61 ug/L.

5.2.8 Metals

Analyzed metals were detected in the groundwater samples collected at the Eastern Landfill site. Sixteen metals (aluminum, antimony, barium, beryllium, cadmium, cobalt, copper, iron, lead, manganese, mercury, nickel, selenium, thallium, tin and zinc) were detected above the reporting limits but at concentrations below the respective EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for these compounds. One compound (silver) was not detected above the reporting limits in any of the groundwater samples.

Arsenic was detected above the reporting limit in three groundwater samples collected from monitor well EMW03 at concentrations ranging from 0.00355 mg/L to 0.00725 mg/L. The concentrations detected exceed the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for arsenic of 0.000045 mg/L.

Chromium was detected above the reporting limit in four groundwater samples collected from monitor wells EMW02 and EMW03 at concentrations ranging from 0.00952 mg/L to 0.117 mg/L. The concentration (0.117 mg/L) detected in the duplicate sample collected from monitor well EMW03 exceeds the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for chromium VI of 0.11 mg/L.

Vanadium was detected above the reporting limit in four groundwater samples collected from monitor wells EMW02 and EMW03 at concentrations ranging from 0.00302 mg/L to 0.0936 mg/L. The concentrations (0.081 mg/L to 0.0936 mg/L) detected in the groundwater samples collected from monitor well EMW03 exceeds the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for vanadium of 0.037 mg/L.

5.2.9 Water Quality Parameters

Various water quality parameters were analyzed for as part of the Groundwater Investigation. The analytical results for the water quality parameters are presented in Table 5.2-1.

5.3 Groundwater Elevation Measurements

A groundwater elevation survey was conducted at nine monitoring wells located at the Eastern Landfill, Work Shop, Administration and TNT Leaching Bed Areas. These monitor wells included TMW02, TMW05, TMW14A, TMW16, TMW17, TMW18, TMW19, FW35 and TMW28.

All water level measurements were obtained with an electronic water level monitor. Measurements were made relative to a notch or other permanent mark which serves as a consistent reference point. These measurements were accurate to 0.01 feet. Table 5.3-1 presents the results of the groundwater

elevation measurements. Water level measurements were collected on July 30, 2004.

Table 5.3-1

WATER LEVEL MEASUREMENTS FOR EXISTING MONITOR WELLS

**Groundwater Investigation – Eastern Landfill
Fort Wingate Depot Activity, Gallup, New Mexico**

Monitor Well	Depth to Water (feet)
TMW02	53.88
TMW05	35.88
TMW14A	62.95
TMW16	54.58
TMW17	61.46
TMW18	53.27
TMW19	41.00
TMW28	18.45
FW35	14.50

Note:

1. Water level measurements collected between 1215 and 1340 hours on 07/30/04.
2. Water level measured in feet from top of casing.

Water level measurements were collected at the monitor wells installed during the Groundwater Investigation. Table 5.3-2 presents the results of the water level measurements at the monitor wells EMW01 through EMW04 installed as part of the Groundwater Investigation.

Monitor well EMW01 was installed on July 14, 2004. Water was not detected in the monitor well until August 2, 2004. At the completion of field activities on August 3, 2004, the height of the column of water measured was approximately 14 feet.

Monitor well EMW02 was installed on July 19, 2004. Water was detected in the well the next day. The maximum water column height measured was approximately 75 feet.

Monitor well EMW03 was installed on July 21, 2004. Water was detected in the well the next day. The maximum water column height measured was approximately 64 feet high.

Monitor well EMW04 was installed on July 23, 2004. Water was not detected in the monitor well until August 2, 2004. At the completion of field activities on August 3, 2004, the maximum water column height measured was approximately 0.5 feet.

Table 5.3-2

WATER LEVEL MEASUREMENTS FOR NEWLY INSTALLED MONITOR WELLS

**Groundwater Investigation – Eastern Landfill
Fort Wingate Depot Activity, Gallup, New Mexico**

Date	EMW01	EMW02	EMW03	EMW04	Comments

7/16/04	Dry	--	--	--	
7/20/04	--	98.05	--	--	
7/21/04	Dry	86.64	89.80	--	
7/22/04	--	68.51	79.66	--	
7/23/04	Dry	56.35	48.71	--	
7/26/04	Dry	35.55	36.30	Dry	Developed EMW02 and EMW03
7/27/04	--	77.95	63.65	--	Developed EMW02 and EMW03
7/28/04	--	80.56	--	--	Sampled EMW02
7/29/04	--	--	54.88	--	Sampled EMW03
7/30/04	Dry	66.90	77.35	Dry	
8/2/04	119.90	50.61	46.30	116.99	
8/3/04	106.95	47.57	43.78	117.05	

Note:

1. -- indicates that the well was not yet installed or a measurement was not collected for that day.
2. Water level measured in feet from top of casing.

As discussed above and shown on Table 5.3-2, recharge to the wells was very slow. The water levels did not reach stabilization in any of the wells during the field activities. Because of this lack of stabilization, the direction and gradient of groundwater flow at the Eastern Landfill could not be determined.

5.4 Aquifer Testing

Aquifer tests (rising and falling head slug tests) were performed on monitor wells EMW02 and EMW03 to estimate hydraulic conductivity. The procedures employed for performing the slug tests are discussed in Section 3.4.

Hydraulic conductivities were calculated using the slug test methods of Bouwer and Rice, 1976 and Hvorslev, 1951. Graphical solutions and calculations were performed using AQTESOLV for Windows Professional (Version 3.50), an aquifer test analysis software package. Aquifer test data and calculations are included in Appendix G.

Table 5.4-1 presents hydraulic conductivity estimates for monitor wells EMW02 and EMW03.

Table 5.4-1

6.0 CONCLUSIONS AND RECOMMENDATIONS

6.1 Analytical Findings and Conclusions

The Groundwater Investigation conducted at the Eastern Landfill at FWDA consisted of the collection and chemical analysis of two groundwater samples.

Groundwater

In summary, VOCs, SVOCs, pesticides, explosives, PCBs, and metals were detected in the groundwater samples collected from the Eastern Landfill for chemical analysis. Herbicides and dioxins/furans were not detected in the groundwater samples. One SVOC, two pesticides, one explosive and three metals exceeded their respective EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003).

The concentration of bis(2-ethylhexyl)phthalate in the duplicate sample collected from monitor well EMW03 (0.00682 mg/L) exceeds the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for bis(2-ethylhexyl)phthalate of 0.0048 mg/L.

The concentrations of Dieldrin (0.0000139 mg/L) and Heptachlor Epoxide (0.0000587 mg/L) detected in the triplicate sample collected from monitor well EMW03 exceed the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for these compounds of 0.0000042 mg/L and 0.0000074 mg/L, respectively.

The concentration of RDX (2.9 micrograms per liter [ug/L]) detected in one groundwater sample collected from monitor well EMW02 exceeds the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for this compound of 0.61 ug/L.

The concentrations of arsenic detected (0.00355 mg/L to 0.00725 mg/L) in the groundwater samples collected from monitor well EMW03 exceed the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for arsenic of 0.000045 mg/L.

The concentration of chromium detected (0.117 mg/L) in one groundwater sample collected from monitor well EMW03 exceeds the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for chromium VI of 0.11 mg/L.

The concentrations of vanadium detected (0.081 mg/L to 0.0936 mg/L) in the groundwater samples collected from monitor well EMW03 exceeds the EPA Region 6 Human Health Medium-Specific Screening Levels for Tap Water (Version 6, November 2003) for vanadium of 0.037 mg/L.

The water levels in the monitor wells did not reach stabilization during the field activities. Because of this lack of stabilization, the direction and gradient of groundwater flow at the Eastern Landfill could not be

determined.

6.2 Recommendations

This section presents recommendations for further action at the Eastern Landfill site based on the results of the Groundwater Investigation.

The following further action recommendations are presented:

1. Conduct one round of groundwater elevation measurements to determine groundwater flow direction and gradient.
2. Confirm the detections of analytes in groundwater by conducting a second round of groundwater sampling.
3. Develop and collect groundwater samples from monitor wells EMW01 and EMW04.

TBD: To Be Determined

APPENDIX B

CHRONOLOGY OF FIELD EVENTS

APPENDIX B

CHRONOLOGY OF FIELD EVENTS Eastern Landfill, Fort Wingate Depot Activity, Gallup, New Mexico

- 12 JUL 04 L. Basilio and J. Robertson (TtNUS) arrived at site. Met with Duke Davis (FWDA Caretaker) and Steve Deeter (PMC) to discuss field program and site activities. Met with Mike Sisk (TPL) to coordinate access into TPL controlled areas. Surveyor (ASTS, Inc.) arrived to stake proposed boring locations. IDW contractor (Rinchem, Inc.) delivered roll-off bin for solid IDW and plastic totes for liquid IDW. Drilling contractor (Enviro-Drill) arrived at site. Health and safety briefing was conducted for drillers and field personnel. Driller sets up decontamination pad and equipment staging area. The drilling rig and equipment were decontaminated. Set up at soil boring location EMW01.
- 13 JUL 04 Soil boring EMW01 drilled to 115 ft bgs using hollow stem augers.
- 14 JUL 04 Resumed drilling soil boring EMW01 with hollow stem augers to 120 ft bgs. Installed monitor well, 2-inch PVC with 15 feet of screen, into the soil boring. Added filter pack and bentonite seal. The bearing seals on drill rig drive shaft required repair. Shutdown operations as driller had to go into town for parts repair.
- 15 JUL 04 Set up at soil boring location EMW02. Soil boring EMW02 drilled to refusal at 67.5 ft bgs using hollow stem augers. The drilling rig was reconfigured for air rotary drilling. At 1330 hrs, lightning was spotted in the area. Drilling operations were suspended for the remainder of the day due to weather.
- 16 JUL 04 Resumed drilling soil boring EMW02. Soil boring EMW02 was drilled to 120 ft bgs using air rotary technique. Installed monitor well, 2-inch PVC with 15 feet of screen, into the soil boring. During construction of the monitor well, immediately after the placement of the bentonite chips into the annulus, a petroleum odor was noticed emanating from the borehole. The source of the petroleum odor was traced to the bentonite chips. It was discovered that a loose connection on a gasoline container located on the driller's work truck had allowed gasoline to spill on to one of the bags of bentonite chips stored on the work truck. Upon discovering this, the just installed well was immediately pulled from the borehole, the bentonite and sand pack were drilled out and the hole was then overdrilled with hollow stem augers to a

total depth of 120 ft bgs. The hole was then plugged and abandoned with a cement/bentonite grout.

- 19 JUL 04 Moved location of soil boring EMW02 approximately 19 feet to east. Redrilled soil boring EMW02 to a total depth of 110 ft bgs using air rotary drilling technique. Installed monitor well, 2-inch PVC with 15 feet of screen, into the soil boring. Added filter pack and bentonite seal. Set up drill rig at soil boring location EMW03. Soil boring EMW03 was drilled to 10 ft bgs using hollow stem augers.
- 20 JUL 04 Resumed drilling soil boring EMW03. At 75 ft bgs the CME sampler unscrewed from the drill rods. The driller had to fish the sampler out of the hole. Soil boring EMW03 was drilled to refusal at 85 ft bgs using hollow stem augers. The drilling rig was reconfigured for air rotary drilling.
- 21 JUL 04 Resumed drilling soil boring EMW03 with air rotary technique. Soil boring EMW03 was drilled to 100 ft bgs. Installed monitor well, 2-inch PVC with 15 feet of screen, into the soil boring. Added filter pack and bentonite seal. Set drill rig up at soil boring location EMW04. Soil boring EMW04 drilled to refusal at 42 ft bgs with hollow stem augers. Completed well construction at EMW02 by grouting annulus.
- 22 JUL 04 Completed well construction at monitor wells EMW02 and EMW03 by grouting annulus. Configure drilling rig air rotary drilling. Collected field blank FW-EMW04-FBLK01, a water sample from the drill rig holding tank. Sample was delivered to FEDEX for overnight delivery to Severn Trent Laboratories.
- 23 JUL 04 Resumed drilling soil boring EMW04 with air rotary techniques. Soil boring EMW04 was drilled to total depth of 120 ft bgs. Installed monitor well, 2-inch PVC with 15 feet of screen, into the soil boring. Added filter pack and bentonite seal. Collected field blank FW-EMW04-FBLK02, a water sample from the designated FWDA standpipe. Collected a soil IDW composite sample from the roll-off bin, IDW-SOIL. Samples were delivered to FEDEX for overnight delivery to Severn Trent Laboratories.
- 26 JUL 04 Developed monitor wells EMW02 and EMW03. The wells were pumped dry and TtNUS informed USACE. USACE instructed TtNUS to develop wells as best as possible under circumstances and to complete all soil borings as permanent monitor wells.

27 JUL 04 Completed well construction at monitor wells EMW01 and EMW04 by grouting annulus. Developed monitor wells EMW02 and EMW03. Both wells were pumped dry again. Drill set surface pads and posts.

28 JUL 04 Collected rinsate blank FW-EMW02-RNSW. Collected groundwater sample from monitor well EMW02 using a bladder pump. Collected sample FW-EMW02. Collected composite sample of IDW liquids, IDW-WATER. Continued setting surface pads and posts. Driller demobilized from site. Samples were delivered to FEDEX for overnight delivery to Severn Trent Laboratories.

29 JUL 04 Collected groundwater sample from monitor well EMW03 using a bladder pump. Collected sample FW-EMW03, FW-EMW03-FDUP (duplicate sample), and FW-EMW03-FTRP (triplicate sample). Surveyor was onsite to measure horizontal and vertical coordinates of monitor well locations. Samples were delivered to FEDEX for overnight delivery to Severn Trent Laboratories. Triplicate water sample shipped to Datchem Laboratory by overnight carrier.

30 JUL 04 Conducted slug testing of monitor wells EMW02 and EMW03. Collected water level measurements from nine existing FWDA monitor wells.

02 AUG 04 Measured water levels in newly installed monitor wells. Begin to demobilize from site.

03 AUG 04 Measured water levels in newly installed monitor wells. IDW contractor (Rinchem) picked up roll-off bin and plastic totes. TtNUS demobilizes and leaves site. Field activities completed.

APPENDIX C

INVESTIGATION-DERIVED WASTE DISPOSAL MANIFESTS

SPECIAL WASTE SHIPMENT RECORD

B.N # 104051

Rio Rancho Sanitary Landfill

Shipment # **35779**

Mailing Address: P.O. Box 15700
 Rio Rancho, NM 87174
 505/892-2055

Physical Address: 33rd St. & Northern Blvd.
 Rio Rancho, NM 87144
 SWM #231402

Profile # CI 0834

1. Generator's work site name and address <i>Rinchem Company, Inc 5133 Edith Blvd NE Albuquerque NM 87107</i>		
2. Generator's name and address <i>Rinchem Company, Inc 5133 Edith Blvd NE Albuquerque, NM 87107</i>		Generator's Telephone no.
3. Authorized Agent's name and mailing address (if different from #2) <i>Rinchem Company, Inc 5133 Edith Blvd NE Albuquerque, NM 87107</i>		Agent's Telephone no.
4. Proper name and type of waste <i>TRM < 1000 PPM NON DOT NON RCRA REGULATED (SOIL CONTAMINATED WITH OIL) (Soil from Drilling)</i>	5. Containers No. Type <i>1 CM Roll-off</i>	6. Total quantity (yd3) (tons) <i>15</i>
7. Special handling instructions:		
8. GENERATOR'S OR AUTHORIZED AGENT'S CERTIFICATION: I hereby declare that the contents of this consignment are fully and accurately described above by proper shipping name and are classified, packed, marked, and labeled, and are in all respects in proper condition for transport by highway in accordance with applicable international and government regulations. I hereby certify that the above named material does not contain free liquid as defined by 40CFR Part 258.28 and is not a hazardous waste as defined by 40CFR 261 or any applicable state law.

1.0 EXECUTIVE SUMMARY

Eight (8) water samples (including two investigation water samples, one investigation-derived waste [IDW] sample, one quality control (QC) sample, one quality assurance (QA) sample, two field blanks and one equipment blank) and one soil sample were collected from July 22 to July 29, 2004, by Tetra Tech NUS, Inc. (TtNUS) for the Groundwater Investigation of the Eastern Landfill at the Fort Wingate Depot Activity (FWDA), Gallup, New Mexico.

The analytical results and the associated QC data were received and reviewed in accordance with “USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review” and “USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review”. The validation was conducted based on the United States Environmental Protection Agency (USEPA) Functional Guidelines for Level III data package deliverables. The data were evaluated based on accuracy, precision, representativeness, completeness and sensitivity.

Chain-of-Custody Forms, Cooler Receipt Forms, and data sheets including the quality control package were complete and contained the required information.

One QA water sample was sent to the U.S. Army Corps of Engineers (USACE) certified laboratory (DataChem Laboratories) for analysis. This data review also includes a discussion of the QA sample results.

Overall, the data meet the general requirements of the approved work plan (January 2004) for the site and should be considered valid and acceptable.

2.0 INTRODUCTION

This data validation report represents a comprehensive data quality assessment of analytical data generated by TtNUS as part of the Groundwater Investigation of the Eastern Landfill at FWDA, Gallup, New Mexico. The environmental samples collected at the site from July 22 to July 29, 2004 were analyzed by Severn Trent Laboratories (STL).

2.1 Testing Laboratory Identification Numbers

The analytical results of the Groundwater Investigation sampling events were reported and assigned a Sample Delivery Group (SDG) for each event.

2.2 Number of Samples Tested by Medium

Eight (8) water samples (including two investigation water samples, one IDW sample, one QC sample, one QA sample, two field blanks and one equipment blank) were collected. Additionally, one soil sample from IDW (IDW-Soils) was collected. These samples were analyzed by STL.

One QA water sample (FW-EMW03-FTRP) was sent to the USACE certified laboratory (DataChem Laboratories) for analysis. This data review also includes a discussion of the QA sample results in Section 6.0.

2.3 Analytical Methods Used

The water and soil samples were analyzed by STL in accordance with federal guidance documents which establish definitive analytical/technical elements, i.e., Environmental Protection Agency (EPA) SW-846 Methods and other EPA methods. The following analytical methods were used:

- Method 6010B Inductively Coupled Plasma Atomic Emission Spectroscopy (Trace ICP) or Method 6020A (ICP/Mass Spectrometry (MS)) for metals in total and dissolved fractions;
- Method 7470A/7471A cold vapor for mercury in total and dissolved fractions;
- Method 8260B for volatile organics;
- Method 8270C for semi-volatile organics;
- Method 8151A for herbicides;
- Method 8081A for pesticides;
- Method 8141 for organophosphorus pesticides;
- Method 8082 for polychlorinated biphenyls (PCBs);
- Method 8082 for PCB congeners;
- Method 8290 for Dioxins/Furans;
- Method 8330 for explosives; and
- Wet Chemistry: pH (EPA 150.1); Total Dissolved (TDS, EPA 160.1); chloride, fluoride, sulfate, and nitrate as nitrogen (NO₃-N, EPA 300); nitrite as nitrogen (NO₂-N, EPA 353.2); sulfide (EPA 376.1); and Cyanide (SW846, 9012A).

3.0 OBJECTIVES

Data Quality Objectives (DQOs) are qualitative and quantitative statements that specify the quality of data required to support decisions made during the investigative activities of a project. The objective of this data validation is to review laboratory analytical procedures and quality control results to verify the usability of data toward meeting project DQOs as provided in the USACE approved “Work Plans” dated January 2004.

Data collected as part of the Groundwater Investigation at Fort Wingate Depot Activity, Gallup, New Mexico will be used to determine if metals, volatile organics, semivolatile organics, herbicides, pesticides, PCBs and PCB congeners, dioxins/furans, and explosives have been released to the groundwater.

DQOs define the methods to be used in site activities and were developed to ensure the following:

- Precision and accuracy of data are well defined and adequate to provide defensible data.
- Samples are collected using approved techniques and are representative of existing environmental conditions.
- QA/QC procedures for both field and laboratory procedures meet the USACE’s guidance document requirements.

4.0 DATA REVIEW / VALIDATION RESULTS

The validation procedures used for this report are based on “USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Data Review” and “USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review”. The validation was conducted based on Level III data package deliverables. The data are evaluated based on accuracy, precision, representativeness, completeness, and sensitivity.

Level III data deliverables were composed of the following:

- Original Chain of Custody for referencing field identification and laboratory identification for each sample, and dates for sample collection, receiving, and tests required;
- Case narrative discussing any anomalies encountered in the handling and analysis of the samples;
- List of sample quantitation or reporting limit for each analyte;
- Data report for field samples; and
- Quality Control Documentation:
 - Method blank data
 - Surrogate recovery results
 - Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD) results
 - Matrix Spike/Matrix Spike Duplicate (MS/MSD) results

Data were evaluated based on the following parameters as appropriate:

- Data completeness
- Holding time
- Gas Chromatography/Mass Spectrometry (GC/MS) tuning and system performance
- Laboratory method and field quality control blank results
- Initial and continuing calibration
- Surrogate spike recovery
- Matrix Spike/Matrix Spike Duplicate results (MS/MSD)
- Laboratory control samples or blank spike samples (LCS/LCSD)
- Internal standard performance
- Relative Percent Difference (RPD)
- Compound identification
- Compound quantitation
- Detection limits and Reporting limits

Each of these parameters is discussed in each SDG.

4.1 Holding Time

Holding times are defined as the time between sample collection and extraction or sample collection and analysis. If a sample exceeds a holding time for a specified method, then the results may be biased low.

4.2 Blanks

The purpose of laboratory or field blank analysis is to determine the existence and magnitude of contamination resulting from laboratory or field activities. The criteria for evaluation of blanks apply to any blank associated with the sample (e.g., method blanks and equipment blanks). Method blanks (MB) consist of high-performance liquid chromatography (HPLC) water that is carried through the analytical scheme like the environmental sample. A method blank is prepared and analyzed for each batch of samples. A trip blank is prepared at the analytical laboratory by pouring analyte-free reagent water into a 40-ml Teflon-lined septum vial. The trip blank will accompany the sample containers into the field, but will remain unopened until analyzed in the laboratory after being returned from the field. A trip blank thus serves to identify contamination of the samples that might occur during transport of sample containers from the laboratory to the field and from the field to the laboratory. A rinsate or equipment blank is a vial of rinsate collected in the field following the cleaning of the sampling equipment and analyzed to determine any contaminant carry-over from the previous sampling event. A field blank is a sample of source water used for decontamination. In accordance with the work plan, one field blank was collected of water from the driller's water storage tank and one field blank was collected of water from the FWDA standpipe identified by the FWDA caretaker.

4.3 Laboratory Control Samples

The LCS recovery is performed with each analytical batch, method, and matrix. LCS samples are the best indicator for the laboratory as to their instrument performance (accuracy and precision); thus indicating whether or not there are matrix effects.

4.4 Surrogate Recovery

Surrogates are compounds that are chemically representative of the method target compounds. Once the analysis is performed, the surrogate percent recovery (%R) is calculated. If a sample requires dilution for analysis, the surrogate is typically diluted below detectable concentrations. In these cases, an evaluation of recovery can not be made.

4.5 Matrix Spike and Matrix Spike Duplicate

Matrix spikes (MS) are aliquots of samples to which known amounts of analytes have been added or "spiked" into the matrix of interest. MS and MS duplicate (MSD) samples are subject to the same preparation or extraction procedure and analyzed as the normal environmental samples. MS/MSD samples are analyzed per 10 samples or per batch. The percent spike recovery measures sample matrix interference effects, and reflects the accuracy of the determination. Accuracy is expressed as the percent recovery of an analyte from a surrogate or matrix spike sample or from a laboratory control sample. If a problem is due to matrix interference with a particular sample or group of samples, this information should be noted in the report.

4.6 Relative Percent Difference

Precision for a single analyte is expressed as a relative percent difference (RPD) between results of MS and MSD or duplicates. Accuracy is a measure of bias in the analysis process. For laboratory duplicate analysis, if the RPD value is greater than 20% for water samples and 35% for soil samples, a qualifier "J" or "UJ" is applied for positive and nondetected results, respectively. For field duplicate analysis, if the RPD value is greater than 30% for water and 50% for soil samples, a qualifier "J" or "UJ" is applied for positive and nondetected results, respectively. If the concentration of the sample is less than 5 times of method quantitation limit (MQL) or reporting limit (RL), the duplicate sample difference is greater than two times of MQL for water, or three times of MQL for soil samples, a qualifier "J" or "UJ" is applied for positive and nondetected results, respectively.

Based on the results of this evaluation, validated data may be qualified to alert the user of limitations associated with the data.

The following definitions provide brief explanations of the nationally used qualifiers assigned to results in the data review process:

- U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.
- UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
- R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria.

5.0 RESULTS

This data validation report represents a comprehensive data quality assessment of analytical data generated by TtNUS as part of the Groundwater Investigation of the Eastern Landfill at Fort Wingate Depot Activity, Gallup, New Mexico.

Eight (8) water samples (including investigation samples, equipment rinsate sample, trip blank, hydrant water, drilling rig tank water, and investigation-derived water) were collected from July 22 to July 29, 2004, by TtNUS. Additionally, one investigation-derived soil sample was collected. The samples collected were analyzed by Severn Trent Laboratories (STL).

Findings from each analytical report are discussed in the following subsections, and the appropriate qualifiers and their rationale for each finding are reported. Data quality is assessed by accuracy, precision, representativeness and completeness parameters which measured the reproducibility of analytical results, the representativeness of site environmental conditions, and the consistency in the performance of the analytical methods. These parameters are discussed for each fraction of analyses (Metals and Mercury, VOCs, SVOCs, Herbicides, Pesticides, Organophosphorus Pesticides, PCBs and its congeners, dioxins/furans, Explosives, and Wet Chemistry). It should be noted that only sample results with noncompliance or outside the quality control limits are mentioned in the following sections.

The Chain-of-Custody Forms and Cooler Receipt Forms were complete and contained the required information. Lists of the field sample identification, laboratory identification with respective sample delivery group (SDG) for the environmental samples, and the analytical parameters are presented in Table 1.

The sensitivity parameters, such as the method detection limits (MDL), sample quantitation limit (SQL), and reporting limit (RL) were approved by the client before the investigation. The SQL is defined as the MDL adjusted for sample-specific action such as dilution or use of varying sample aliquot sizes. The RL is set at the lowest standard used for the initial calibration curve for each target analyte. Target analyte value detected and reported below the RL must be flagged as an estimated quantity (i.e., J-flag).

Data quality is assessed only by accuracy, precision, representativeness and completeness parameters in the following subsections. The qualified analytical data with the rationale for each finding are provided for each fraction in each SDG in Table 2. Field precision is presented in Table 3.

5.1 Metals

SW-846 Method 6010B (Trace ICP) was used to analyze 19 metals (aluminum, antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, iron, lead, manganese, nickel, selenium, silver, thallium, tin, vanadium and zinc), and Method 7470 or 7471 (cold vapor) was used to analyze mercury for soil and water samples.

The following Sample Delivery Groups (SDGs) were analyzed: SDG 278051 (water samples), and SDG 278116 (soil sample). SDG 278051 consisted of seven samples with different laboratory identification (Lab. ID) numbers. SDG 278116 contained only one soil sample (IDW-Soils).

5.1.1 SDG: 278051

Seven (7) water samples were analyzed for metals.

5.1.1.1 Accuracy

For the metals analysis, seven samples were prepared and analyzed in three different batches. The %R criterion does not apply to the sample concentrations greater than 4 times the spike concentrations. FW-EMW04-FBLK01 was used as field MD/MSD and duplicate samples for the metals analysis. FW-EMW04-FBLK02 was used for the field MS/MSD and duplicate samples for mercury analysis. FW-EMW02 and IDW-Water were used for the field MS/MSD samples for metals analysis in lieu of laboratory control sample (LCS) and the duplicate (LCSD). The %Rs of aluminum MS/MSD in IDW-Water sample were greater than the QC limits, however, the post-digestion spike recoveries were acceptable, and the spike recoveries for LCS were within the quality control (QC) limits. Therefore, the matrix effect is suspected. The positive result of aluminum was qualified as estimated “J” for the affected sample (IDW-Water). All other %Rs of MS/MSD were within the acceptable QC limits.

5.1.1.2 Precision

Relative percent difference (RPD) values for duplicate samples (laboratory duplicate, field MS/MSD) were reported within QC limits with the following exceptions: tin and silver in the IDW-Water sample; and iron, manganese, thallium and zinc in FW-EMW02, due to low sample concentrations and no qualification is required.

5.1.1.3 Representativeness

The method blank analyses were reported within QC limits. All samples were digested and analyzed within the proper holding times. The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information. The calibration blank and the initial and continuing calibration verification were acceptable.

5.1.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.1.2 **SDG: 278116**

One soil sample (IDW-Soils) was analyzed for metals.

5.1.2.1 Accuracy

IDW-Soil sample was used for field MD/MSD and duplicate samples for the metal analysis. The %R criterion does not apply to the sample concentrations greater than 4 times the spike concentrations (aluminum, barium, iron and manganese). The %Rs of antimony, selenium and tin recoveries in the MS/MSD were below the QC limits due to matrix interference. The post digestion spike (PDS) results were acceptable. The spike recoveries for LCS were within the quality control (QC) limits. The positive results were qualified as estimated “J” for the affected sample (IDW-Soil).

5.1.2.2 Precision

Eighteen relative percent difference (RPD) values for MS/MSD were above the QC limits due to the non-homogenous nature of the sample. No qualification was required. The RPD values for field duplicate results (IDW-Soil) were acceptable. No qualification was required.

The percent difference (%D) value of barium and iron for serial dilution check sample was outside the QC limits. A qualifier of “J” was applied to the positive results of the affected sample. No qualification is required for low analyte concentrations (less than 50 times of MDL).

5.1.2.3 Representativeness

The method blank analyses were reported within QC limits. All samples were digested and analyzed within the proper holding times. The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information. The calibration blank and the initial and continuing calibration verification were acceptable.

5.1.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.2 VOCs

SW-846 Method 8260B was used to analyze volatile organic compounds (VOCs) for soil and water samples. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report. The following SDGs were analyzed: SDG 278051 (water samples), and SDG 278116 (soil sample).

5.2.1 SDG: 278051

Seven (7) water samples were analyzed for VOCs.

5.2.1.1 Accuracy

For the volatile organic analysis, the matrix spike recoveries (%R) were analyzed from non-project samples. The %R of styrene in MSD was below the QC limit due to matrix interference. No qualification is required.

The laboratory control sample (LCS) recoveries were within the QC limits. Surrogate recoveries for all samples were within QC limits. No qualification is required.

5.2.1.2 Precision

Relative percent difference (RPD) values for MS/MSD were reported within QC limits. The RPD for field duplicate samples (FW-EMW03 and FW-EMW03-Dup) were acceptable.

5.2.1.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank analyses were reported within QC limits. No analytes of interest were detected in the method blank. However, acetone was detected in a trip blank (0.0012 mg/L). Acetone in the samples (FW-EMW02, FW-EMW02-RNSW and IDW-Water) were qualified as nondetected "U" since the values were less than ten times (10X) the trip blank value. All internal standard recoveries were within acceptable limits.

5.2.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.2.2 SDG 278116

One soil sample (IDW-Soils) was analyzed for VOCs.

5.2.2.1 Accuracy

For the volatile organic analysis, sample IDW-Soils was selected to analyze as MS/MSD in lieu of a laboratory control duplicate (LCD). The %R of 4-methyl-2-pentanone in MSD was slightly below the QC limit due to matrix interference. No qualification is required.

The laboratory control sample (LCS) recoveries were within the QC limits. Surrogate recoveries were within QC limits. No qualification is required.

5.2.2.2 Precision

All relative percent difference (RPD) values were reported within QC limits. The percent difference (%D) of acrolein in the continuing calibration verification (CCV) analysis was reported to be above in-house acceptance limit. Since the %D was within method acceptance limit, no corrective action was required.

5.2.2.3 Representativeness

The sample was prepared and analyzed within the proper holding times. The method blank analyses were reported within QC limits. No analytes of interest were detected in the method blank.

All internal standard recoveries were within acceptance limits. The 10 ppb standard for all compounds was not used to calibrate the initial curve due to equipment failure. The initial calibration was accepted since the remaining five levels were compliant with method requirements.

5.2.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.3 SVOCs

SW-846 Method 8270C was used to analyze SVOCs for soil and water samples. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report. The following SDGs were analyzed: SDG 278051 (water samples), and SDG 278116 (soil sample).

5.3.1 SDG: 278051

Seven (7) water samples were analyzed for SVOCs.

5.3.1.1 Accuracy

For the semivolatile organic analysis, several analytes in the matrix spike recoveries (%R) for field MS/MSD samples (FW-EMW03) were outside the QC limits due to matrix interference. Because the laboratory control sample (LCS) recoveries were within the QC limits. No qualification is required. Surrogate recoveries for all samples were within QC limits, no qualification is required.

5.3.1.2 Precision

Relative percent difference (RPD) values for most of duplicate samples (field MS/MSD) were reported within QC limits, some analytes were outside the QC limits due to matrix interference and no qualification is required.

5.3.1.3 Representativeness

The method blank was free of contamination and analyses were reported within QC limits. All samples were extracted and analyzed within the proper holding times. Initial calibration and calibration verification were within acceptable limits.

5.3.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.3.2 **SDG: 278116**

One soil sample (IDW-Soils) was analyzed for SVOCs.

5.3.2.1 Accuracy

For the semivolatile organic analysis, the sample IDW-Soils was selected to analyze as MS/SMD in lieu of a LCD. Several analytes in the matrix spike recoveries (%R) for field MS/MSD sample were outside the QC limits due to matrix interference. Because the laboratory control sample (LCS) recoveries were within the QC limits, no qualification is required. Surrogate recoveries for this sample were within QC limits, no qualification is required.

5.3.2.2 Precision

Relative percent difference (RPD) values for MS/MSD duplicate samples were reported within QC limits.

5.3.2.3 Representativeness

The method blank was free of contamination and analyses were reported within QC limits. All samples were extracted and analyzed within the proper holding times. Initial calibration and calibration verification were within acceptable limits.

5.3.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.4 **Herbicides**

SW-846 Method 8151A was used to analyze for herbicides in water and soil samples. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report. The following SDGs were analyzed: SDG 278051 (water samples), and SDG 278116 (soil sample).

5.4.1 SDG: 278051

Seven (7) water samples were analyzed for Herbicides.

5.4.1.1 Accuracy

For the herbicides analysis, the laboratory analyzed a Blank Spike/Blank Spike Duplicate (BS/BSD) with each extraction batch in lieu of LCD. All spike recoveries (%Rs) for BS/BSD were within the QC limits. Surrogate recoveries (%Rs) were within the QC limits.

5.4.1.2 Precision

Relative percent difference (RPD) values for BS/BSD were reported within QC limits. Initial calibration and CCVs were within acceptance limits.

5.4.1.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits.

5.4.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.4.2 SDG: 278116

One soil sample was analyzed for Herbicides.

5.4.2.1 Accuracy

For the herbicide analysis, non-project MS/MSD samples were used. The LCS recoveries were within the QC limits. Surrogate recovery (%R) was within the QC limits.

5.4.2.2 Precision

Relative percent difference (RPD) values for MS/MSD were reported within QC limits. Initial calibration and calibration verification were within acceptance limits.

5.4.2.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits.

5.4.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.5 Pesticides

SW-846 Method 8081A was used to analyze for Pesticides for soil and water samples. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report. The following SDGs were analyzed: SDG 278051 (water samples), and SDG 278116 (soil sample).

5.5.1 **SDG: 278051**

Seven (7) water samples were analyzed for Pesticides.

5.5.1.1 Accuracy

For the pesticides analysis, no MS or MSD sample was designated, so LCSs/LCDs were analyzed. Several analytes in LCS (PLCSW2) recoveries were below the acceptance criteria due to the laboratory inadvertently spilling the LCS during the extraction process. The %Rs of delta BHC in LCD (PLCSW2) on both columns were above the acceptance criteria. No qualifier was required for the nondetected result. Two other batches LCSs/LCDs recoveries were within the QC limits and no qualification is required. Surrogate recoveries for all samples were within QC limits.

5.5.1.2 Precision

Relative percent difference (RPD) values for duplicate samples (LCS/LCD) were reported within QC limits, and no qualification is required.

The percent difference (%D) of four compounds (Endosulfan II, Endosulfan sulfate, 4,4'-DDT and Methoxychlor) in Continuing Calibration Verification (CCVs) were above the QC limits. The nondetected results of these four analytes in the affected samples were qualified as estimated "UJ".

5.5.1.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits.

5.5.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.5.2 SDG: 278116

One soil sample (IDW-Soils) was analyzed for Pesticides.

5.5.2.1 Accuracy

For the pesticides analysis, the matrix spike recoveries (%Rs) for field MS/MSD samples and LCS sample were within the QC limits. Surrogate recoveries of the sample were within QC limits.

5.5.2.2 Precision

Relative percent difference (RPD) values for duplicate samples (field MS/MSD) were reported within QC limits.

5.5.2.3 Representativeness

The sample was prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits.

5.5.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.6 Organophosphorus Pesticides

EPA Method 8141 was used to analyze organophosphorus pesticides in water samples. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report. The following SDG was analyzed: SDG 278051.

Four (4) water samples were analyzed for organophosphorus pesticides at STL Tallahassee Laboratory. Samples FW-EMW04-FBLK01 and FW-EMW04-FBLK02 were assigned as T414636, and FW-EMW03 and FW-EMW03-Dup were assigned as T414726.

5.6.1 Accuracy

Surrogate recoveries (%Rs) for all samples were within the QC limits. The matrix spike recoveries (%Rs) for field MS/MSD samples were within QC limits. The laboratory blank and blank spike samples recoveries (LCS/LCSD) were within the QC limits and no qualifier is required.

5.6.2 Precision

Relative percent difference (RPD) values for LCS/LCSD were within the QC limits and no qualification is required.

5.6.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits.

5.6.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.7 PCBs

SW-846 Method 8082 was used to analyze for PCBs in water and soil samples. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report. The following SDGs were analyzed: SDG 278051 (water samples), and SDG 278116 (soil sample).

5.7.1 SDG: 278051

Seven (7) water samples were analyzed for PCBs.

5.7.1.1 Accuracy

For the PCB analysis, all matrix spike recoveries (%Rs) for MS/MSD samples (non-project samples) were within the QC limits. The Aroclor 1016 recovery on column RTX-CLP1 in sample PLCSW2 was below the acceptance criteria. All data were reported from column RTX-CLP2. All analytes from the other LCSs and LCDs recoveries were within the QC limits. No qualification is required.

Surrogate recovery (%R) of decachlorobiphenyl (DCB) on column RTX-CLP1 in sample FW-EMW03-Dup and %R of tetrachloro-*m*-xylene (TCX) on column RTX-CLP1 in sample IDW-Water were marginally outside the acceptance limits. The %R DCB on column RTX-CLP2 in sample FW-EMW03-Dup was greater than the QC limits, and %R TCX on column RTX-CLP2 in sample IDW-Water was lower than the QC limit due to matrix interference. No qualification is required.

5.7.1.2 Precision

Relative percent difference (RPD) values for MS/MSD were reported within QC limits. Initial calibration met criteria. One individual %D each in five CCVs was above acceptance criteria. Since the average %Ds across all analytes in these CCVs were within acceptance limits, no qualification is required.

5.7.1.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits.

5.7.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.7.2 **SDG: 278116**

One soil sample was analyzed for PCBs.

5.7.2.1 Accuracy

For the PCB analysis, all matrix spike recoveries (%Rs) for MS/MSD samples were within the QC limits. The LCS recoveries were within the QC limits. Surrogate recoveries were within the acceptable limits.

5.7.2.2 Precision

Relative percent difference (RPD) values for MS/MSD were reported within QC limits. Initial calibration and calibration verification were within acceptance limits.

5.7.2.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits.

5.7.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.8 **PCB Congeners**

EPA Method 8082 was used to analyze PCB Congeners in water samples. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report. The following Sample Delivery Groups (SDGs) were analyzed: H4G280221 and H4H020105.

5.8.1 **SDG: H4G280221**

Two (2) water samples were analyzed for PCB Congeners at STL Knoxville Laboratory. Samples FW-EMW04-FBLK01 and FW-EMW04-FBLK02 were assigned as H4G280221-001 and H4G280221-002.

5.8.1.1 Accuracy

Surrogate recoveries (%Rs) for all samples were within the QC limits. The laboratory blank and blank spike sample recoveries (LCS/LCSD) were within the QC limits and no qualifier is required. Due to limited sample volume, MS/MSD analysis was not performed.

5.8.1.2 Precision

Relative percent difference (RPD) values for LCS/LCSD were within the QC limits and no qualification is required.

5.8.1.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information. The calibration blank and the initial and continuing calibration verification were acceptable. The method blank contained a small amount of 2,2',3,3',4,4',5,5',6-nonachlorobiphenyl (0.0012 microgram/liter (ug/L)) and 2,2',5-trichlorobiphenyl (0.0096 (ug/L)). The two field samples also contained a small amount of 2,2',3,3',4,4',5,5',6-nonachlorobiphenyl due to blank contamination. A nondetected qualifier of "U" is applied to the analytical result of these two samples. Other analyses were reported within QC limits.

5.8.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.8.2 SDG: H4H020105

Four water samples were analyzed for PCB Congeners at STL Knoxville Laboratory. Samples FW-EMW03 was assigned as H4H020105-001, FW-EMW03-DUP was assigned as H4H020105-002, FW-EMW02 was assigned as H4H020105-003 and FW-EM02-RNSW was assigned as H4H020105-004.

5.8.2.1 Accuracy

Surrogate recoveries (%Rs) for all samples were within the QC limits. The laboratory blank and blank spike sample recoveries (LCS/LCSD) were within the QC limits and no qualifier is required. Due to limited sample volume, MS/MSD analysis was not performed.

5.8.2.2 Precision

Relative percent difference (RPD) values for LCS/LCSD were within the QC limits and no qualification is required.

5.8.2.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information. The calibration blank and the initial and continuing calibration verification were acceptable. The method blank contained a small amount of 2,2',3,3',4,4',5,5',6-nonachlorobiphenyl (0.0013 ug/L). The three field samples also contained a small amount of this analyte due to blank contamination. A nondetected qualifier of "U" is applied to the analytical result of these three samples. Other analyses were reported within QC limits.

5.8.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.9 Dioxins/Furans

EPA Method 8290 was used to analyze Dioxins/Furans in water samples. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report. The following Sample Delivery Groups (SDGs) were analyzed: H4G280221 and H4H020105.

5.9.1 **SDG: H4G280221**

Two (2) water samples were analyzed for Dioxins/Furans at STL Knoxville Laboratory. Samples FW-EMW04-FBLK01 and FW-EMW04-FBLK02 were assigned as H4G280221-001 and H4G280221-002.

5.9.1.1 Accuracy

Internal standard recoveries (%Rs) for all samples were within the QC limits. The laboratory blank and blank spike sample recoveries (LCS/LCSD) were within the QC limits and no qualifier is required. Due to limited sample volume, MS/MSD analysis was not performed.

5.9.1.2 Precision

Relative percent difference (RPD) values for LCS/LCSD were within the QC limits and no qualification is required.

5.9.1.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank contained a small amount of OCDD (4.5 picogram per liter (pg/L)), 1,2,3,4,7,8-HxCDF (0.85 pg/L), 2,3,4,7,8-PeCDF (1.3 pg/L) and OCDF (2.8 pg/L). However, these analytes were not detected in the field samples. No qualification is required. Other analyses were reported within QC limits.

The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information. The calibration blank and the initial and continuing calibration verification were acceptable.

5.9.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.9.2 SDG: H4H020105

Four water samples were analyzed for Dioxins/Furans at STL Knoxville Laboratory. Sample FW-EMW03 was assigned as H4H020105-001, FW-EMW03-DUP was assigned as H4H020105-002, FW-EMW02 was assigned as H4H020105-003 and FW-EM02-RNSW was assigned as H4H020105-004.

5.9.2.1 Accuracy

The %Rs of internal standards for all samples were within the QC limits. The laboratory blank and blank spike sample recoveries (LCS/LCSD) were within the QC limits and no qualifier is required. Due to limited sample volume, MS/MSD analysis was not performed.

5.9.2.2 Precision

Relative percent difference (RPD) values for LCS/LCSD were within the QC limits and no qualification is required.

5.9.2.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank contained a small amount of OCDD (3.4 picogram per liter (pg/L)), 1,2,3,4,6,7,8-HpCCD (0.9 pg/L), 1,2,3,4,7,8-HxCDF (0.75 pg/L), and OCDF (3.0 pg/L). A nondetected qualifier of "U" is applied to the analyte of the affected samples. Other analyses were reported within QC limits.

The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information. The calibration blank and the initial and continuing calibration verification were acceptable.

5.9.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.10 **Explosives**

SW-846 Method 8330 was used to analyze for explosives in water and soil samples at STL Burlington laboratory. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report. The following SDGs were analyzed: SDG 278051 (water samples), and SDG 278116 (soil sample). The results have been reported from the LC-18 analytical column only. The Photo Diode Array Spectra (PDA) was also performed for further confirmation of the results.

5.10.1 **SDG: 278051**

Seven (7) water samples were analyzed for Explosives at STL Burlington laboratory. Samples FW-EMW04-FBLK01 and FW-EMW04-FBLK02 were assigned as ETR 101499, samples FW-EMW02 and FW-EMW02-RNSW were assigned as ETR 101563, samples FW-EMW03 and FW-EMW03-Dup were assigned as ETR 101579, and the sample IDW-WATER was assigned as ETR 101562. The results have been reported from the LC-18 analytical column only.

5.10.1.1 **Accuracy**

In ETR 101499, the surrogate recoveries were within the QC limits. The analysis of the blank spike sample U3LCS exhibited percent recoveries of the target compounds HMX and TNX that were marginally below the control limits. No qualification is required. No MS/MSD analysis was requested and performed by the laboratory. The LCS recoveries were within the QC limits.

In ETR 101563 and ETR 101579, surrogate recoveries of 1,2-dinitrobenzene on the CN column for samples FW-EMW02, FW-EMW02RNSW, FW-EMW03 and FW-EMW03-Dup were above the QC limits. The laboratory suspected that the anomaly may be due to the sample matrix. However, only the results of the primary column (LC-18) were reported and they were all within the QC limits. No MS/MSD analysis was requested and performed by the laboratory. The LCS recoveries were within the QC limits.

In ETR 101562, the surrogate recoveries were within the QC limits. No MS/MSD analysis was requested and performed by the laboratory. The LCS recoveries were within the QC limits.

5.10.1.2 **Precision**

Relative percent difference (RPD) values for LCS/LCSD were within the QC limits. Percent difference (%D) in Calibration Verification (CV) were above the criteria for TNX and DNX in the affected samples (FW-EMW02, FW-EMW02-RNSW, FW-EMW03, and FW-EMW03-Dup). The affected analytes were qualified as estimated “J” for positive results, and estimated nondetect “UJ” for the nondetected results.

The detected analytes were confirmed by a second column (CN column) and by the Photo Diode Array Spectra (PDA). The results have been reported from the LC-18 analytical column only.

5.10.1.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits.

In ETR 101499, during the analysis of LCS sample (U3LCS) on the CN analytical column, the following coelutions occur: Picric acid with 2,6 dinitrotoluene and DNX with 2,6-dinitrotoluene and 2,4-dinitrotoluene.

During the analysis of the laboratory standards on the CN column, the following coelutions occur: 1,3,5-trinitrobenzene with 1,3-dinitrobenzene, 2,4,6-trinitrotoluene with 2,4-nitrotoluene, and 2-nitrotoluene with 3-nitrotoluene.

In ETR 101563 and ETR 101579, during the analysis of the blank spike and duplicate spike (V1LCS/V1LCSD) on the CN column, the following coelutions occurred: picric acid with 2,6-dinitrotoluene and DNX with 2,6-dinitrotoluene and 2,4-dinitrotoluene.

During the analysis of the laboratory standards on the CN column, the following coelutions occur: 1,3,5-trinitrobenzene with 1,3-dinitrobenzene, 2,4,6-trinitrotoluene with 2,4-nitrotoluene, and 2-nitrotoluene with 3-nitrotoluene and 4-nitrotoluene.

In ETR 101562, during the calibration on the CN column, the following coelutions occur: 2,4,6-trinitrotoluene with 2,4-dinitrotoluene, and 1,3,5-trinitrobenzene and 1,3-dinitrobenzene, 3-nitrotoluene, 2-nitrotoluene and 4-nitrotoluene. The laboratory suspected the presence of matrix interference in the field sample IDW-Water. As such, Photo Diode Array (PDA) spectra was utilized, however, the PDA was determined to be non-supportive of the reported concentrations of the target compounds. The laboratory noted a retention time shift on the CN column and utilized the quality control samples to assist in the identification of the target analytes RDX and 2-amino-4,6-dinitrotoluene. These target analytes were identified within their appropriate retention time windows.

5.10.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is at least 95.5% compared to the minimum acceptance limit of 90%.

5.10.2 SDG: 278116

One soil sample (IDW-Soils) was analyzed for Explosives by STL Burlington laboratory. IDW-soils was assigned as ETR 101500.

5.10.2.1 Accuracy

For the Explosives analysis, LCS recoveries were within the QC limits. Surrogate recovery of 1,2-dinitrobenzene was within the QC limits. No MS/MSD analysis was performed by the laboratory.

5.10.2.2 Precision

No laboratory duplicate samples were performed.

5.10.2.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits. Initial calibration and calibration verification criteria were met.

5.10.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

5.11 Wet Chemistry

Wet Chemistry parameters were analyzed: pH (EPA 150.1); Total Dissolved Solids (TDS, EPA 160.1); chloride, fluoride, sulfate, and nitrate-nitrogen (NO₃-N, EPA 300); Nitrite-nitrogen (NO₂-N, EPA 353.2); sulfide (EPA 376.1); and cyanide (SW846, 9012A).

RCI (reactivity, corrosivity and ignitability) were measured for the IDW-Soils sample. Reactivity (cyanide and sulfide) by using EPA SW-846, Method 7.3; Corrosivity (pH) by using EPA SW-846, Method 9045C; and Ignitability (flashpoint) by using ASTM, Method D92-85.

5.11.1 SDG: 278051

Seven samples were analyzed for wet chemistry parameters. Since pH is a field parameter, the holding time had expired by the time the samples received at the laboratory, but it was analyzed as soon as received. The laboratory control sample (LCS) and its duplicate sample, LCD recoveries were within the quality control limits. FW-EMW02 and FW-EMW03 were selected to analyze as a duplicate sample (DUP) in lieu of a LCD. The RPD values were within the acceptable limit. All other quality criteria were met.

5.11.2 SDG: 278116

One sample (IDW-Soils) was analyzed for RCI parameters. All quality control criteria were met.

6.0 QUALITY ASSURANCE SAMPLE RESULTS

This data validation report represents a comprehensive data quality assessment of analytical data generated by TtNUS as part of the Groundwater Investigation of Eastern Landfill at Fort Wingate Depot Activity, Gallup, New Mexico. This investigation was conducted from July 22 to July 29, 2004.

One quality assurance (QA) water sample (FW-EMW03-FTRP) was sent to the U.S. Army Corps of Engineers certified laboratory (DataChem Laboratories and its subcontractors) for analysis. This section includes a discussion of the QA sample results.

Analytical reports were received from DataChem Laboratories. Findings from each analytical report are discussed in the following subsections, and the appropriate qualifiers and their rationale for each finding are reported. Data quality are assessed by accuracy, precision, representativeness and completeness parameters which measured the reproducibility of analytical results, the representativeness of site environmental conditions, and the consistency in the performance of the analytical methods. They are discussed for each fraction of analyses (Metals, VOCs, SVOCs, Herbicides, Pesticides, Organophosphorus Pesticides, PCBs and its congeners, dioxins/furans, Explosives, and Wet Chemistry). It should be noted that only sample results with noncompliance or outside the quality control limits were mentioned in the following sections.

The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information.

The sensitivity parameters, such as the method detection limits (MDL), sample quantitation limit (SQL), and reporting limit (RL) were approved by the client before the investigation. The SQL is defined as the MDL adjusted for sample-specific action such as dilution or use of varying sample aliquot sizes. The RL is set at the lowest standard used for the initial calibration curve for each target analyte. Target analyte value detected and reported below the RL must be flagged as an estimated quantity (i.e., J-flag).

The qualified analytical data with the rationale for each finding are provided for each fraction in Table 4.

6.1 Metals

SW-846 Method 6010B (Trace ICP) was used to analyze two metals (aluminum and iron) in a water sample (FW-EMW03-FTRP). SW-846 Method 6020A (ICP/MS) was used to analyzed 17 metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, manganese, nickel, selenium, silver, thallium, tin, vanadium and zinc), and Method 7470A (cold vapor) was used to analyze mercury for the water sample.

6.1.1 Accuracy

In 6010B analysis, the percent recoveries (%Rs) of aluminum and iron in MS/MSD and LCS were within the QC limits. The post-digestion spike recoveries were acceptable. No qualification is required.

In 6020A analysis, the percent recoveries (%Rs) of TAL analytes in MSD and LCS were within the QC limits, except for nickel, selenium, silver and zinc in MS sample. The post-digestion spike recoveries were acceptable except for nickel due to matrix interference. No qualification is required.

In Method 7470A analysis, the %R of mercury in MS/MSD and LCS were within the QC limits.

6.1.2 Precision

Relative percent difference (RPD) values for duplicate samples (field MS/MSD and matrix duplicate (MD)) were reported within QC limits except for iron due to matrix interference.

The %D values for serial dilution check sample were within the QC limits. No qualification is required for low analyte concentrations (less than 50 times of MDL).

6.1.3 Representativeness

The method blank analyses were reported within QC limits. All samples were digested and analyzed within the proper holding times. The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information. The calibration blank and the initial and continuing calibration verification were acceptable.

6.1.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.2 VOCs

SW-846 Method 8260B was used to analyze VOCs for two water samples (FW-EMW03-FTRP and a trip blank). A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report.

6.2.1 Accuracy

For the volatile organic analysis, the %Rs in MS/MSD was within the QC limits. No qualification is required.

The laboratory control sample (LCS) recoveries were within the QC limits except for iodomethane. Surrogate recoveries for all samples were within QC limits. No qualification is required.

6.2.2 Precision

Relative percent difference (RPD) values for MS/MSD were reported within QC limits. The RPD for field duplicate samples (FW-EMW03 and FW-EMW030Dup) were acceptable.

6.2.3 Representativeness

The sample was prepared and analyzed within the proper holding times. The method blank analyses were reported within QC limits. No analytes of interest were detected in the method blank. All internal standard recoveries were within acceptable limits.

Several of the Appendix IX compounds were not available at the laboratory for an MDL study before the expiration date of the samples. These compounds are not routinely analyzed and were not standardized for. They were, however, screened for and if detected would have been reported as unknowns. MDL values for the following compounds were taken from a 1997 study and are included for informational purposes only: methyl methacrylate, propionitrile, acetonitrile, 1,4-dioxane, isobutyl alcohol, methacrylonitrile, and 1-chloro-1-3-butadiene. However, none was detected in this analysis.

6.2.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.3 SVOCs

SW-846 Method 8270C was used to analyze SVOCs for a water sample (FW-EMW03-FTRP). A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report.

6.3.1 Accuracy

The spike recoveries (%R) for laboratory control samples (LCS/LCD) were within the QC limits. Matrix spike was not performed. No qualification is required. Surrogate recoveries for the sample were within QC limits, no qualification is required.

6.3.2 Precision

Relative percent difference (RPD) values for duplicate samples (LCS/LCD) were reported within QC limits.

6.3.3 Representativeness

The sample was extracted and analyzed within the proper holding time. Initial calibration and calibration verification were within acceptable limits.

The method blank contained di-n-butylphthalate (0.001mg/L). The di-n-butylphthalate in the sample (FW-EMW03) was qualified as nondetected “U” since the value was less than ten times (10X) the method blank value.

Hexachlorophene cannot be reported by this method. This analyte was not detected in the calibration standards even though it was included in the solution. N-nitrosodiphenylamine broke down to diphenylamine in the injection port and cannot be distinguished from diphenylamine. The 3-methylphenol coeluted with 4-methylphenol. The two isomers cannot be distinguished from each other.

6.3.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.4 Herbicides

SW-846 Method 8151A was used to analyze herbicides for a water sample (FW-EMW03-FTRP). A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report.

6.4.1 Accuracy

For the herbicides analysis, spike recoveries (%Rs) of laboratory control sample (LCS) and laboratory control duplicate (LCD) were within the QC limits. MS and MSD were not prepared. Surrogate recoveries (%Rs) were within the QC limits. All surrogate recoveries were within QC limits except for method blank that was 3% lower than QC limits.

6.4.2 Precision

Relative percent difference (RPD) values for LCS/LCD were reported within QC limits. Initial calibration and CCVs were within acceptance limits.

6.4.3 Representativeness

The sample was prepared and analyzed within the proper holding time. The method blank was free of contamination and analyses were reported within QC limits. Initial calibration and continuing calibration verification were within acceptable limits.

6.4.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.5 Pesticides

SW-846 Method 8081 A was used to analyze pesticides for a water sample (FW-EMW03-FTRP). A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report.

6.5.1 Accuracy

For the pesticides analysis, no MS or MSD sample was designated, so LCSs/LCDs were analyzed. Surrogate recoveries for all samples were within QC limits.

6.5.2 Precision

Relative percent difference (RPD) values for duplicate samples (LCS/LCD) were reported within QC limits, and no qualification is required.

6.5.3 Representativeness

The sample was prepared and analyzed within the proper holding time. The method blank contained 0.00000368 mg/L of 4,4'-DDD. The 4,4'-DDD in the sample (FW-EMW03) was qualified as nondetected "U" since the value was less than ten times (10X) the method blank value. Initial calibration and continuing calibration verification were within acceptable limits.

6.5.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.6 Organophosphorus Pesticides

EPA Method 8141 was used to analyze organophosphorus pesticides for a water sample (FW-EMW03-FTRP) by Columbia Analytical Services, Inc. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report.

6.6.1 Accuracy

Surrogate recoveries (%Rs) for all samples were within the QC limits. The matrix spike sample was not performed. The laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) recoveries (LCS/LCSD) were within the QC limits and no qualifier is required.

6.6.2 Precision

Relative percent difference (RPD) values for LCS/LCSD were within the QC limits and no qualification is required.

6.6.3 Representativeness

The sample was prepared and analyzed within the proper holding time. The method blank was free of contamination and analyses were reported within QC limits.

6.6.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.7 PCBs

SW-846 Method 8082 was used to analyze PCBs for a water sample (FW-EMW03-FTRP). A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report.

6.7.1 Accuracy

For the PCB analysis, all data were reported from column RTX-CLP. All analytes from the LCSs and LCDs recoveries were within the QC limits. No MS/MSD was prepared.

Surrogate recoveries (%Rs) of tetrachloro-*m*-xylene (TCX) and decachlorobiphenyl (DCB) for all samples were within the QC limits except for the %R of DCB for the FW-EMW03 was below the QC limit. No qualification is required.

6.7.2 Precision

Relative percent difference (RPD) values for LCS/LCSD were within QC limits. Initial calibration and continuing calibration verification met criteria.

6.7.3 Representativeness

The sample was prepared and analyzed within the proper holding time. The method blank was free of contamination and analyses were reported within QC limits.

6.7.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.8 PCB Congeners

EPA Method 8082 was used to analyze PCB Congeners for a water sample (FW-EMW03-FTRP) by Northeast Analytical. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report.

6.8.1 Accuracy

Surrogate recovery (%R) for the sample was within the QC limits. The laboratory control sample spike recovery was within the QC limits and no qualifier is required.

6.8.2 Precision

No duplicate sample was performed.

6.8.3 Representativeness

The sample was prepared and analyzed within the proper holding time. The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information.

6.8.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.9 Dioxins/Furans

EPA Method 8290 was used to analyze Dioxins/Furans for a water sample (FW-EMW03-FTRP) by Columbia Analytical Services, Inc. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report.

6.9.1 Accuracy

The standard recoveries (%Rs) for the samples were within the QC limits. The LCS recoveries were within the QC limits and no qualifier is required. The MS/MSD samples were performed from non-project sample, and the %Rs were acceptable.

6.9.2 Precision

Relative percent difference (RPD) values for MS/MSD were reported to be within the QC limits and no qualification is required.

6.9.3 Representativeness

All samples were prepared and analyzed within the proper holding time. The method blank contained a small amount of OCDD (7.982 picogram per liter (pg/L)). However, this analyte was not detected in the field sample. No qualification is required.

The Chain-of-Custody Form and Cooler Receipt Form were complete and contained the required information. The initial and continuing calibration verification were acceptable.

6.9.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.10 Explosives

SW-846 Method 8330 was used to analyze explosives in a water sample (FW-EMW03-FTRP). The results have been reported from the C18 column only. A list of site-specific analytes is presented in Table 5.1.2-2 of the Groundwater Investigation Report.

6.10.1 Accuracy

For the Explosives analysis, LCS recoveries were within the QC limits. Surrogate recovery of 3,4-dinitrobenzene was within the QC limits. No MS/MSD analysis was performed.

6.10.2 Precision

Relative percent difference (RPD) values for LCS/LCD were reported to be within the QC limits and no qualification is required.

6.10.3 Representativeness

All samples were prepared and analyzed within the proper holding times. The method blank was free of contamination and analyses were reported within QC limits. Initial calibration and calibration verification criteria were met.

6.10.4 Completeness

Completeness has been evaluated by comparing the total number of samples collected with the total number of samples with valid analytical data. The completeness for this SDG is 100%.

6.11 Wet Chemistry

Wet Chemistry parameters were analyzed: pH (EPA 9040B); Total Dissolved Solids (TDS, EPA 160.1); chloride, fluoride, sulfate, and nitrate as nitrogen (NO₃-N, EPA 300); Nitrite as nitrogen (NO₂-N, EPA 353.2); sulfide (EPA 9030); and cyanide (SW846, 9012A).

One sample (FW-EMW03-FTRP) was analyzed for wet chemistry parameters. The laboratory control sample (LCS) recoveries were within the quality control limits with the exception of total sulfide. Low recovery is common for total sulfide because the sulfide reference solution is not stable. The RPD values were within the acceptable limit. MS/MSD recoveries and RPD were within the QC limits. All other quality criteria were met.

The sample was prepared and analyzed within the proper holding time. The method blank was free of contamination and analyses were reported within QC limits. Initial calibration and calibration verification criteria were met.

APPENDIX E

ELECTRONIC DATA DELIVERABLE

The electronic data files for the Groundwater Investigation at the Eastern Landfill will be provided to the FWCOE Project Manager on a floppy disk as part of the Final Groundwater Investigation Report submittal.

APPENDIX F

SUMMARY OF ANALYTICAL RESULTS

LIST OF TtNUS DATA QUALIFIERS

Groundwater Investigation – Eastern Landfill Fort Wingate Depot Activity, Gallup, New Mexico

The following qualifiers were used to validate the analytical data from the groundwater samples collected at Eastern Landfill. The following definitions, per EPA's National Functional Guidelines, provide brief explanations of the nationally used qualifiers assigned to analytical results during the data validation/review process:

- U** The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- J** The analyte was positively identified, but the associated numerical value is an approximate concentration of the analyte in the sample.
- UJ** The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit necessary to accurately and precisely measure the analyte concentration in the sample.
- R** The sample was rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte can not be verified.

APPENDIX G

AQUIFER TEST DATA

ELF02 SLUG OUT TEST

PROJECT INFORMATION

Company: Tetra Tech NUS, Inc.
 Client: USACE Fort Worth District
 Project: N7551-794A
 Location: Eastern Landfill
 Test Well: ELF02
 Test Date: 07/30/04

AQUIFER DATA

Saturated Thickness: 5. ft Anisotropy Ratio (K_z/K_r): 1.

WELL DATA (ELF02)

Initial Displacement: 1.017 ft Static Water Column Height: 38.2 ft
 Total Well Penetration Depth: 5. ft Screen Length: 15. ft
 Casing Radius: 0.083 ft Wellbore Radius: 0.25 ft

SOLUTION

Aquifer Model: Confined Solution Method: Bouwer-Rice
 $K = 5.925E-7$ ft/sec $y_0 = 0.7262$ ft

Data Set: S:\COE\Wingate\Eastern Landfill - Site Investigation\Slug Test\ELF02 Out.aqt
 Title: ELF02 Slug Out Test
 Date: 11/15/04
 Time: 11:09:50

Company: Tetra Tech NUS, Inc.
 Client: USACE Fort Worth District
 Project: N7551-794A
 Location: Eastern Landfill
 Test Date: 07/30/04
 Test Well: ELF03

AQUIFER DATA

Saturated Thickness: 13. ft
 Anisotropy Ratio (Kz/Kr): 1.

SLUG TEST WELL DATA

Test Well: : ELF03

X Location: 0. ft
 Y Location: 0. ft

Initial Displacement: 1.031 ft
 Static Water Column Height: 18.55 ft
 Casing Radius: 0.083 ft
 Wellbore Radius: 0.25 ft
 Well Skin Radius: 0.25 ft
 Screen Length: 15. ft
 Total Well Penetration Depth: 13. ft

No. of Observations: 89

Observation Data			
Time (sec)	Displacement (ft)	Time (sec)	Displacement (ft)
0.	1.03	276.	0.74

SOLUTION

Aquifer Model: Confined
 Solution Method: Hvorslev
 Shape Factor: 4.788

VISUAL ESTIMATION RESULTS

Estimated Parameters

Parameter	Estimate	
K	2.944E-7	ft/sec
y0	0.8178	ft

AUTOMATIC ESTIMATION RESULTS

Estimated Parameters

Parameter	Estimate	Std. Error	
K	4.625E-7	1.924E-8	ft/sec
y0	0.8178	0.008074	ft

Parameter Correlations

	K	y0
K	1.00	0.53
y0	0.53	1.00

Residual Statistics

for weighted residuals

Sum of Squares 0.2464 ft²
 Variance 0.002833 ft²
 Std. Deviation 0.05322 ft
 Mean -0.002534 ft
 No. of Residuals 89
 No. of Estimates 2
