

Ted: Attached please find a recent email addressing the eco work plan For your file but wait for steve smith to chime in please.

## ENVIRONMENTAL PERFORMANCE STANDARDS FOR CAMU

As required by the environmental performance standards in the New Mexico Administrative Code, Title 20, Chapter 4, Part 1 (NMAC 20.4.1) and Code of Federal Regulations, Title 40, Part 264, Subpart X (40 CFR 264.601), the Corrective Action Management Unit (CAMU) must be located, designed, constructed, operated and closed in a manner that will protect human health and the environment.

I. Nearest Receptors [40 CFR 264.601(a)(5); (a)(6); and (a)(7)] Well 69, the water supply well for FWDA, is installed in the Glorieta Sandstone at a depth of 1,350 feet bgs. It is located distance? feet, direction? of the CAMU and has a pumping capacity of rate? gallons per minute (gpm). FWDA does not contain any housing facilities.

The nearest residential area to the proposed CAMU is the town of Fort Wingate, with a population of 1,364. This town is located approximately 4 miles east-northeast of the proposed CAMU. The town's drinking water well is located distance? miles, direction? of the CAMU.

II. The Army will be performing an ecological risk assessment for the entire FWDA. A draft work plan is being prepared. The ecological risk assessment will be included in the RCRA Facility Investigation (RFI) Work Plan for Parcel 3 being developed under Attachment 4 of the RCRA Part B Permit. The RFI Work Plan will describe the human populations and environmental systems that currently or potentially are at risk of contaminant exposure. In addition, the species present and expected to be present will be identified. This risk assessment should be sufficient to characterize the conditions at the CAMU.
