SUBJECT: Army Pollution Abatement Program Study, Hazardous Waste Management
Consultation, Fort Wingate Depot Activity, Gallup, NM, 14-15 May
1981 (USAEEHA Control No. 81-26-8263-81)

Commander
DARCOMI & SA
ATTN: DRCIS-RI-IC
Rock Island, IL 61299

1. This study was conducted to develop data necessary for obtaining waivers
for the ground-water monitoring requirements at the Ft Wingate Depot Activity
TNT wastewater leaching beds. Subsurface characteristics, water balance, and
nearby water supplies were considered during the study in terms of potential
migration of hazardous waste from the facility to the uppermost aquifer.

2. The facility has a low potential for hazardous waste migration to the
uppermost aquifer due to site and facility characteristics. Existing data,
as presented in this report, appear to be adequate to support the waiver.
Although it is not required until Part B submission, it is recommended that a
request for a waiver of ground-water monitoring requirements be submitted by
the installation to the US Environmental Protection Agency, Region VI, using
this report to provide the technical support for the waiver request.

ARMY POLLUTION ABATEMENT PROGRAM STUDY
HAZARDOUS WASTE MANAGEMENT CONSULTATION
FORT WINGATE DEPOT ACTIVITY
GALLUP, NEW MEXICO
14-15 MAY 1981
(USAEEHA CONTROL NO. 81-26-8263-61)

1. AUTHORITY. Letter, DRCIS-A, HQ, DARCOM, 2 February 1981, subject: Request for Assistance, RCRA, and endorsements thereto.
2. REFERENCES. See Appendix A for a listing of references.
3. PURPOSE. To develop data necessary for preparation of a waiver for ground-water monitoring requirements at a hazardous waste site to be in compliance with the Resource Conservation and Recovery Act (RCRA) (reference 1, Appendix A) and in accordance with 40 CFR 265, Subpart F (reference 2, Appendix A).

4. GENERAL.

a. Personnel Contacted.

- (1) MAJ Tetreault, Commander, Fort Wingate Depot Activity
- (2) Mr. Adrian Bond, Environmental Coordinator, Fort Wingate Depot Activity
- (3) Mr. L. Vargas, Fire Chief, Fort Wingate Depot Activity
- (4) Mr. David Olszewski, Enforcement Official, US Environmental Protection Agency (EPA) Region VI
- (5) Mr. Ray Krehoff, Engineer, New Mexico Environmental Improvement Board

b. Location and Mission. The Ft Wingate Depot Activity is located 11 miles east of Gallup, New Mexico. The installation operates as a storage facility for the care, preservation, and maintenance of assigned commodities.

c. Regulatory Considerations. Administration of the hazardous waste management program in the State of New Mexico is presently being accomplished by the EPA, Region VI, located in Dallas, Texas. Requirements for data to be submitted in support of a ground-water monitoring waiver are listed in 40 CFR 265, Subpart F. Waivers may be developed and retained by the owner/operator of a hazardous waste facility from 19 November 1981 until EPA requests submission of the Part B, RCRA permit and the waiver (reference 2, Appendix A). However, it is recommended that coordination with EPA and the State be initiated at this time. The State of New Mexico does not have interim

Hazardous Waste Mgt Consultation No. 81-26-8263-81, Ft Wingate Depot Activity,
NM, 14-15 May 81

primacy at the present time, but receives courtesy copies of any permits or waivers from EPA. Although New Mexico may be granted interim primacy in the future, it is anticipated (reference 8, Appendix A) that the ground-water monitoring requirements will be the same as those in 40 CFR 265, Subpart F. If New Mexico is granted interim authority for hazardous waste facilities, the waiver would be sent to the appropriate State office.

5. FINDINGS AND DISCUSSION.

a. Hazardous Waste Surface Impoundments. TNT wastewater leaching beds are located approximately 400 feet south of the Fort Wingate Depot Activity Administration Area as shown on Figure 1. The twin leaching beds cover an area of 90,000 square feet and are 5 feet deep. The leaching beds contain no water or wastewater at the present time and have been inactive since 1967 (reference 6, Appendix A). There are no plans to reactivate this waste facility in the near future.

b. Subsurface Characteristics.

(1) Soils. Soils in the area of the leaching beds have developed on alluvium of the South Fork of the Puerco River. Fine grained sand is the predominant material with large percentages of silt and clay present.

(2) Geology.

(a) Three geologic units are of primary concern in the area of the leaching beds, as shown on Figure 2. The oldest (Permian age) of these units is the Glorieta sandstone which is the major aquifer for Fort Wingate Depot Activity. The Glorieta sandstone is a fine grained to very fine grained quartz sandstone, cemented with calcium carbonate or silica. Well 69 is 2200 feet north of the leaching beds and is used to characterize the geology of the site. The lithologic log for Well 69 (Appendix B) shows the top of the Glorieta sandstone at 1170 feet below the surface with a thickness of 180 feet.

(b) Overlying the Glorieta sandstone is the Chinle formation which is 1100 feet thick at Well 69 beginning at 70 feet below ground surface. The Chinle consists primarily of claystone with some thin sandstone units and a few thin siltstone units.

(c) The surficial unit is the alluvium of the South Fork Puerco River, which is 70 feet thick at Well 69. This material is described in detail in the lithologic logs for monitoring Wells PW 10, 11, 12, and 13 (Appendix C). The alluvium at the leaching beds is silty sand, silt, and clay. The deepest well, PW 10, encountered a 16.5-foot clay unit from 38 feet to 51.5 feet in depth. This clay may be weathered claystone of the Chinle formation.

NM, 14-15 May 81

Hazardous Waste Mgt Consultation No. SI-26-8263-81, Ft Wingate Depot Activity,
NM, 14-15 May 81

(3) Ground Water. Ground water has not been encountered in the monitoring wells FW 10, 11, 12, 13 with Well FW 10 being the deepest at 51.5 feet (Appendix C). The wells were dry during the environmental survey conducted in late 1980 and early 1981 by Environmental Science and Engineering, Inc. The Glorieta sandstone is the uppermost aquifer at a depth of 1170 feet below the surface at Well 69. The Chinle formation serves as a confining stratum over the Glorieta aquifer. The potentiometric surface of this aquifer is above the ground surface at the leaching beds and Well 69 (Figure 2). The claystone of the Chinle formation effectively stops the downward movement of any water in the alluvium.

c. Climate and Water Balance.

(1) Fort Wingate Depot Activity enjoys a semiarid climate with an annual average precipitation of 10.6 inches. Most of the precipitation comes in the form of thunderstorms, causing large amounts of runoff over a short time period. There are no perennial surface water streams on Fort Wingate Depot Activity.

(2) The dominant factors in a water balance are precipitation and evapotranspiration since surface water and ground-water resources are insignificant near the leaching beds. Annual water gains to Fort Wingate Depot Activity and the leaching beds are 10.6 inches of precipitation. Water losses correspond to the potential evapotranspiration rate which is approximately 52 inches per year (reference 5, Appendix A). The potential net annual water loss calculated from the precipitation and evapotranspiration rates is 41.4 inches at the leaching beds area. The effect of a large negative water balance is to severely limit the ground-water recharge to the regional aquifer. The amount of water reaching an aquifer equals the total infiltration minus the amount of water absorbed by the soil or subsurface material in the unsaturated zone. In semiarid regions, rainfall is rarely sufficient to exceed the storage capacity of the soil. Since the unsaturated zone in the semiarid Fort Wingate Depot Activity area contains very little water from natural sources, a large amount of water from an artificial source would be required before recharge to the ground-water system could occur.

d. Location of Water Sources Near the Leaching Beds. No perennial streams are near the leaching beds. The largest stream to the north of Fort Wingate Depot Activity is the South Fork of the Puerco River which is dry most of the year. The closest water supply well to the leaching beds is Well 69 which is 2200 feet to the north. However, this well taps the Glorieta aquifer, which is separated from the leaching beds by approximately 1000 feet of claystone from the Chinle formation. This claystone is impermeable and therefore acts as a large barrier between the leaching beds and the water supply aquifer.

Hazardous Waste Mgt Consultation No. 81-26-8263-81, Ft Wingate Depot Activity,
NM, 14-15 May 81

6. CONCLUSION. The leaching beds at Fort Wingate Depot Activity are effectively isolated from any surface water and ground water by a high negative water balance and thick impermeable geologic units. Therefore, the potential for contaminant migration to the uppermost aquifer or any surface water is virtually nonexistent.

7. RECOMMENDATIONS.

a. Prepare a request for a waiver for ground-water monitoring at the TNT wastewater leaching beds using this report as the supporting document.

b. Coordinate the ground-water monitoring waiver with EPA and New Mexico State officials, as appropriate.

8. TECHNICAL ASSISTANCE. This Agency will furnish assistance in the implementation of recommendations contained herein, on a continuing basis, as required. Informal technical advice and/or consultation may be obtained telephonically from Chief, Waste Disposal Engineering Division, USAEHA (AUTOVON 584-2024).

<u>Stratigraphic unit and material</u>	<u>Thickness (feet)</u>	<u>Depth (feet)</u>
Pecosian System - Continued:		
San Andres Limestone - Continued:		
Glorieta Sandstone - Continued:		
Sandstone, moderate orange-pink (3 YR 8/4); very fine- to fine-grained; moderately sorted; composed of subangular to rounded, clear, quartz grains; moderately cemented. very slightly calcareous; rare dark accessory minerals; grayish-purple (5 P 4/2) claystone (cavings?) common to abundant _____	70	1,290
Sandstone, moderate orange-pink (5 YR 8/4); same as 1,220-1,290 but samples contain no claystone _____	10	1,300
Sandstone, pale-red (3 R 6/2) to grayish- red (10 R 4/2); silty; very fine- to fine-grained; poorly sorted; composed of angular to subrounded, subac, quartz grains; well cemented; very slightly calcareous; grayish-purple claystone fragments minor to common _____	10	1,310

Hazardous Waste Mgt Consultation No. 81-26-8263-81, Ft Wingate Depot Activity,
NM, 14-15 May 81

<u>Stratigraphic unit and material</u>	<u>Thickness (feet)</u>	<u>Depth (feet)</u>
Permian System - Concluded:		
San Andres Limestone - Concluded:		
Glorieta Sandstone - Concluded:		
Sandszone, moderate orange-pink (5 yr 8/4); fairly well sorted; composed of sub- angular to subrounded, clear to amber, quartz grains; well cemented; contains white clay in matrix; minor white clay- stone fragments —	40	1,350

Hazardous Waste Mgt Consultation No. 31-16-8263-81, Ft Wingate Depot Activity,
R. 14-3 May 81

APPENDIX C

LITHOLOGIC LOGS FOR MONITORING WELLS
AROUND THE LEACHING BEDS

(Source: Environmental Survey, Fort Wingate
Depot Activity, New Mexico, Environmental
Science and Engineering Inc., under contract to
the US Army Toxic and Hazardous Materials
Agency, 1981)

Hazardous Waste Management Consultation No. 81-26-8263-81, Ft Wingate Depot Activity
NM, 14-15 May 81

DRILLING LOG

Boring No. - FW 10 Diameter - 4" ID
 Hole Size - 8" OD Slot - 0.010 Date Start - 20 Nov 80 Finish - 20 Nov 80
 Screen Length - 40' Mat'l - Sch 40 PVC Filter Materials - Silica sand #20
 Diameter - 4" ID Grout Type - Sand cement
 Casing Length - 11' Mat'l - Sch 40 PVC Static Water Level - Water not encountered
 (2' above ground)

Depth (feet)	Lithology, Color
0 - 1.5	SM-MC roots (15%) rock fragments (15%) slightly plastic, loose, moisture: dry, granular, alluvium
1.5 - 3.0	SM-MC w/ rock fragments (15%) slightly plastic, loose, moisture: dry, granular, alluvium
3.0 - 4.5	SM non-plastic, very slightly packed, moisture: less than 2%, granular, alluvium
4.5 - 6.0	SM non-plastic, very slightly packed, moisture: less than 2% granular, alluvium
6.0 - 7.5	SM-SC slightly plastic, very slightly cohesive, moisture: less than 5%, granular, alluvium
7.5 - 9.0	SM-SC slightly plastic - plastic, slightly packed - cohesive, moisture: 5% interbedded clay and sand-rich zones, alluvium, distinct color bands
9.0 - 10.5	SM-SC slightly plastic-plastic, slightly packed-cohesive, moisture: 5%, interbedded clay and sand-rich zones, alluvium, distinct color bands
15.0 - 16.5	SM-SC very slightly plastic, very slightly cohesive, moisture: 5% interbedded clay, and sand-rich zones, distinct color bands, alluvium
20.0 - 21.5	SM-SC slightly plastic, very slightly cohesive, moisture: 5%, interbedded clay and sand-rich zones, distinct color bands, alluvium Lower portion of sample has brown mottling
25.0 - 26.5	SM-SC slightly plastic, slightly cohesive, moisture: less than 2%, granular, alluvium, some gravel present (10%)
30.0 - 31.5	SP-SM non-plastic, moderately packed, moisture: dry, granular, alluvium

Hazardous Waste Management Consultation No. 81-26-8263-81, Ft Wingate Depot Activity
NM, 14-15 May 81

Depth (feet)	Lithology, Color
35.0 - 36.5	CL very sandy (40%) plastic, cohesive, moisture: 5%; interbedded with sand-rich zones, alluvium many color bands
40.0 - 41.5	CL sandy (15%), very plastic, very cohesive, moisture: dry, massive, interbedding with sand-rich zones, alluvium
45.0 - 46.5	CL v. slightly sand (5%), v. plastic, v. cohesive, moisture: less than 2%, massive, alluvium
50.0 - 51.5	CL sandy (15%), very plastic, v. cohesive, moisture: 5%, massive, alluvium

Hazardous Waste Management Consultation No. 81-25-8253-81, Ft Wingate Depot Activity
NM, 14-15 May 81

DRILLING LOG

Boring No. - FW 11 Diameter - 4" ID
 Hole Size - 8" OD Slot - 0.010 Date Start - 28 Nov 80 Finish - 20 Nov 80
 Screen Length - 20' Mat'l - Sch 40 PVC Filter Materials - Silica sand #20
 Diameter - 4" ID Grout Type - Sand: cement 2:1
 Casing Length - 10' (2' above ground) Mat'l - Sch 40 PVC Static Water Level - Water not encountered

Depth (feet)	Lithology, Color
0 - 1.5	CL w/ roots (10%), sandy (30%), plastic, cohesive, moisture: dry, granular to blocky, alluvium
1.5 - 3.0	SM-SC w/ roots (5%), slightly plastic, loose, moisture: dry, granular, alluvium
3.0 - 4.5	SM-SC v. slightly plastic, loose, moisture: dry, granular, alluvium
4.5 - 6.0	SM-SC slightly plastic, loose, moisture: dry, granular to blocky, alluvium w/ roots (10%), color bands evident
6.0 - 7.5	SM non-plastic, slightly packed, moisture: dry, granular, alluvium, faint color bands
7.5 - 9.0	SM-SC slightly plastic, slightly cohesive, moisture: dry, granular, alluvium, faint odor when sampler opened (earthy)
9.0 - 10.5	SM non-plastic, loose moisture: dry, granular, alluvium
15.0 - 16.5	SM-SC slightly plastic, slightly cohesive, moisture: dry, granular, alluvium
20.0 - 21.5	SM-SC slightly plastic, slightly cohesive, moisture: dry, granular, alluvium, some brown mottling through sample
25.0 - 26.5	SM-SC slightly plastic, v. slightly cohesive, moisture: dry, granular to blocky, alluvium, very faint color bands
30.0 - 31.5	SM-SC slightly plastic, slightly cohesive, moisture: dry, granular to blocky, alluvium, color bands, brown mottling

Hazardous Waste Management Consultation No. SI-26-8263-81, Ft Wingate Depot Activity
WM, 14-15 May 81

DRILLING LOG

Boring No.: FW 12	Diameter - 4" ID
Vol. : 1.5 - 6.0' OD	Date Start - 22 Nov 80 Finish - 12 Nov 80
Screen Length - 20' Mat'l - Sch 40 PVC	Filter Materials - Silica sand #20
Diameter - 4" ID	Grout Type - Sand cement 2:1
Casing Length - 11' Mat'l - Sch 40 PVC (2' above ground)	Static Water Level - Water not encountered

Depth (feet)	Lithology, Color
0 - 1.5	ML-CL slightly plastic, slightly cohesive, moisture: dry, blocky, alluvium
1.5 - 3.0	SM, non-plastic, loose, moisture: dry, granular, alluvium
3.0 - 4.5	SM-SC slightly plastic, slightly cohesive, moisture: dry, granular to blocky, alluvium
4.5 - 6.0	SM-SC slightly plastic, slightly cohesive, moisture: dry, blocky, alluvium, color bands visible
6.0 - 7.5	SM-SC slightly plastic, slightly cohesive, moisture: dry, blocky to granular, alluvium, very faint color bands
7.5 - 9.0	CL sandy 10%, plastic, cohesive, moisture: dry, massive to blocky, alluvium
9.0 - 10.5	CL sandy 10%, plastic, cohesive, moisture: dry, massive to blocky, alluvium
10.5 - 15.0	SM non-plastic, loose, moisture: dry, granular, alluvium
15.0 - 16.5	CL black spots (5%), plastic, cohesive, moisture: dry, blocky, alluvium
16.5 - 20.0	ML plastic, cohesive, moisture: dry, blocky to massive, alluvium
20.0 - 21.5	ML black spots (5%), plastic, cohesive, moisture: dry, blocky, alluvium
21.5 - 25.0	ML-CL plastic, cohesive, moisture: dry, blocky to massive, alluvium
25.0 - 26.5	ML-CL plastic, cohesive, moisture: dry, blocky, alluvium
26.5 - 30.0	ML-CL plastic, cohesive, moisture: dry, blocky, alluvium
30.0 - 31.5	ML-CL plastic, cohesive, moisture: dry, blocky, alluvium
