1 EXECUTIVE SUMMARY

2 This Interim Measures Facility-Wide Groundwater Monitoring Plan (GMP) for Fort Wingate
3 Depot Activity (FWDA) describes the proposed groundwater monitoring to be conducted as
4 part of the Environmental Restoration Program at FWDA. This document has been prepared
5 for submission to the New Mexico Environment Department Hazardous Waste Bureau, as
6 required by Section V.A of Resource Conservation and Recovery Act Permit No. NM
7 6213820974 (herein referred to as the Permit).

8
9 The current monitoring well network has been designed to evaluate the horizontal and
10 vertical extent of chemical constituents in groundwater, and the transport of chemicals that
11 originate from multiple sources. Not all wells need to be sampled for the same analytical
12 suites because certain wells are located to monitor releases from specific Solid Waste
13 Management Units (SWMUs) and Areas of Concern (AOCs). The density of the well
14 network is designed such that targeting select wells for specific chemical analyses, rather
15 than all wells, provides sufficient data that meet the objectives of the monitoring program.

16
17 This GMP combines the original 2008 plan (approved) and subsequent revisions (annual),
18 which are revised based on an analysis of historic groundwater monitoring data and a data
19 quality objective (DQO) assessment. In accordance with Section V.A.4 of the Permit, the
20 annual revision of this Interim Measures Facility-Wide GMP re-evaluates the constituent
21 groups to be analyzed and the sampling frequencies at each target well using historical
22 analytical data. To date, sampling frequency has been semi-annual. However, adjusting the
23 sample frequency along with targeting select wells for specific sampling analysis are of
24 central importance to maximizing the amount of relevant information (information required
25 to effectively address the temporal and spatial objectives of monitoring program), while
26 minimizing costs. Section 5.3.1 discusses this Interim Measures Facility-Wide GMP
27 sampling rationale, including the specific chemical constituents to be analyzed and the
28 proposed sampling frequency.

29 30 ***ES.1 PURPOSE***

31 The purpose of this Interim Measures Facility-Wide GMP is to describe the groundwater
32 monitoring program for the interim period before long-term monitoring can begin.

33

1 ***ES.2 PROPOSED INVESTIGATIONS***

2 As described in this revision of the Interim Measures Facility-Wide GMP, the groundwater
3 monitoring program will consist of the following data collection.

4
5 ***ES.2.1 Groundwater Elevation Surveys***

6 Groundwater elevation data will be collected from all existing wells. As directed by New
7 Mexico Environment Department Hazardous Waste Bureau, groundwater elevation data will
8 be collected on a quarterly basis in January, April, July, and October.

9
10 ***ES.2.2 Groundwater Sampling***

11 ***ES.2.2.1 Initial Groundwater Monitoring Program - 2008***

12 The 2008 GMP initially identified semi-annual (April and October) sampling for the
13 following analytical suites for characterization of groundwater at the Open Burning/Open
14 Detonation (OB/OD) Unit and Parcel 3 SWMUs, and the Northern FWDA SWMUs and
15 AOCs (Northern Area).

16
17 ***OB/OD Area (under temporary moratorium until ~2015)***

- 18
19 • Explosives
20 • Nitrate/nitrite
21 • Perchlorate
22 • Target analyte list (TAL) metals (total and dissolved)
23 • White phosphorus
24 • Target compound list (TCL) volatile organic compounds (VOCs)
25 • TCL semi-volatile organic compound (SVOC)
26 • Dioxins and furans
27 • Cyanide
28 • Polychlorinated biphenyls
29 • Pesticides/herbicides

30
31 ***Northern FWDA Area***

- 32
33 • Explosives
34 • Nitrate/nitrite
35 • Perchlorate

- 1 • TAL metals (total and dissolved)
- 2 • TCL VOCs
- 3 • TCL SVOCs
- 4 • Dioxins and furans
- 5 • Pesticides - wells in and around the Administration Area only
- 6 • Diesel range organics - wells monitoring releases from SWMU 45 only
- 7 • Gasoline range organics - wells monitoring releases from SWMU 45 only

8

9 The 2010 revision to the GMP eliminated cyanide, herbicides, polychlorinated biphenyls, and
 10 white phosphorus from the FWDA sampling roster. Based on the absence of detections, it
 11 was determined that continued monitoring for these constituents did not provide necessary
 12 and useful information. Additionally, a statistical analysis of dioxin/furan detections was
 13 submitted to NMED with the intention of eliminating these compounds from the FWDA
 14 sampling program. In August 2011, NMED agreed that dioxins and furans can be eliminated
 15 from the sampling requirements (NMED 2011). The 2012 revision proposed the following
 16 analytical suites and sampling frequencies for the project contaminants of interest (COIs).

Analyte Group	OB/OD Unit*	Northern Area Alluvium*	Northern Area Bedrock*
Explosives	2x	2x	2x
Nitrate/Nitrite	2x	2x	2x
Perchlorate	2x	2x	2x
TAL Metals (total and dissolved)	2x	2x	2x
Mercury (total and dissolved)	2x	2x	2x
TCL VOC	2x	2x	2x
TCL SVOC	x/2	x/2	2x
Pesticides	x/5	x/5	x/5
Diesel Range Organics/ Gasoline Range Organics	N/A	2x	N/A

18 * Select wells only (see Section 5, Table 5-8)

19 2x = Analyses to be performed semi-annually

20 x/2 = Analyses to be performed every 2 years

21 x/5 = Analyses to be performed every 5 years

22 OB/OD = Open burn/open detonation

23 SVOC = Semi-volatile organic compound

24 TAL = Target analyte list

25 TCL = Target compound list

26 VOC = Volatile organic compound

1 ***ES.2.2.2 Revised Groundwater Monitoring Program – 2013 (Version 7)***

2 Sampling activities in the OB/OD area will be under a temporary moratorium while
3 munitions removal activities are conducted in the area. The moratorium is expected to be in
4 effect throughout 2014 and into 2015. The area will not be considered safe and will be
5 closed to all non-essential personal including sampling technicians until the clearance
6 activities are accomplished. The OB/OD area will resume all groundwater monitoring
7 activities on schedule once it is safe to resume. Notification of these activities was submitted
8 in a letter dated June 10, 2013 from Mr. Mark Patterson, BRAC Environmental Coordinator,
9 to Mr. John Kieling, Hazardous Waste Bureau Chief at the New Mexico Environment
10 Department.

11
12 After review of the groundwater monitoring data there are some analytical suites that have
13 not been detected for four consecutive sampling events for some monitoring wells. In
14 accordance to the DQO process and sampling program rationale, these suites are
15 recommended to be removed from the sampling program for the specific wells that have not
16 had detections. Approval from the state will be obtained before implementing these
17 recommendations.

18
19 This revision makes provisions for the East Landfill monitoring wells that will be abandoned
20 when the landfill is removed (estimated winter 2013/spring 2014). The well abandonment
21 activities are subject to NMED approval. If/once the wells are plugged and abandoned they
22 will be removed from the sampling program. While the monitoring wells are existence
23 though, they will continue to be sampled and the groundwater elevations measured.

24
25 Lastly, this revision updates the analytical perchlorate method from EPA Method 6850 to
26 EPA Method 6860 based upon the recommendation of the laboratory and project chemist due
27 to the method being capable of analyzing more perchlorate ions than 6850.
28

1. INTRODUCTION

This Interim Measures Facility-Wide Groundwater Monitoring Plan (GMP) provides guidance for the groundwater monitoring activities to be conducted during calendar year (CY) 2014 at Fort Wingate Depot Activity (FWDA) in McKinley County, New Mexico. If no changes to the GMP are necessary then this guidance will also cover CY 2015. Innovar Environmental, Inc. (herein referred to as Innovar) and CB&I has prepared this GMP for the U.S. Army Corps of Engineers (USACE), Albuquerque District, in accordance with the Statement of Work dated March 2012 (Appendix A) under Contract No. W912PP-11-D-0024, Task Order No. 0007.

This is Version 7 of the Interim Measures Facility-Wide GMP, prepared in accordance with the Resource Conservation and Recovery Act (RCRA) Permit No. NM 6213820974 (the Permit) that became effective on 31 December 2005. Version 7 revises the 2012 GMP to reflect the current site conditions, a recent update in the perchlorate method from 6850 to 6860 which provides more ions for analysis and was recommended by the laboratory and project chemist, a temporary moratorium on sampling activities at the OB/OD area, the scheduled plugging and abandoning of the East Landfill monitoring wells, and recommendations of analytical suites to be removed from the sampling program for specific wells due to non-detect results for four consecutive sampling events. Revisions are based upon analyses of recent sampling data and historic groundwater monitoring data, assessment of data quality objectives (DQOs), utilization of information provided by the USACE, and previous groundwater investigations.

1.1 Background Information

The Secretary of the New Mexico Environment Department (NMED) issued Permit No. NM 6213820974 to the United States, Department of the Army, which is the owner and operator of FWDA. Section V of the Permit (NMED, 2005) requires an NMED-approved plan to provide guidance for interim groundwater monitoring activities for the entire facility prior to implementation of a long-term monitoring plan. Section VIII.B.1 of the Permit (NMED, 2005) requires consultation with the Navajo Nation and the Pueblo of Zuni during preparation of the Interim Measures Facility-Wide GMP and the required annual updates. Responses to comments for this version of the Interim Measures Facility-Wide GMP are presented in Appendix B. Version 7 of this GMP was submitted to the Navajo Nation and Zuni Pueblo as a draft on August 22, 2013. No comments were received within the 60 day review period.

1 The initial 2008 Interim Measures Facility-Wide GMP, prepared by TerranearPMC for the
2 USACE, Fort Worth District, describes the proposed groundwater monitoring to be
3 conducted as part of the Environmental Restoration Program at the FWDA. Section V.A.4 of
4 the Permit (NMED, 2005) requires subsequent annual updates and revisions to the Interim
5 Measures Facility-Wide GMP. Versions 3, 4, and 5 of the Interim Measures Facility-Wide
6 GMP represent the updates for the CYs 2009, 2010, and 2011, respectively. The 2008 GMP
7 is the only plan approved by NMED thus far; however, the subsequent plans are used as
8 reference and guidance for the Version 7 revision.

10 **1.2 Purpose and Objectives**

11 The purpose of Version 7 of the Interim Measures Facility-Wide GMP is to perform a
12 comprehensive assessment of the previous versions of the GMP and to provide
13 recommendations for changes and enhancements. The fundamental objectives for the FWDA
14 groundwater monitoring program are as follows:

- 16 • Evaluate compliance with the Permit groundwater cleanup levels, as identified in
17 Section 7.1 of Attachment 7 to the Permit (NMED, 2005).
- 18 • Identify changes in ambient chemical conditions that affect fate and transport.
- 19 • Evaluate groundwater elevations to determine hydraulic gradients and groundwater
20 flow paths.
- 21 • Monitor temporal changes and detect the movement of contaminants of interest
22 (COIs) from one location to another.

26 COIs are chemicals that exceed or are likely to exceed the groundwater cleanup levels and
27 are associated with known historical waste management activities. Meeting these objectives
28 will support selection of appropriate corrective measures for the FWDA.

30 This Interim Facility-Wide GMP proposes the tasks below to fulfill the interim measures
31 required by the Permit (NMED, 2005). Note: the OB/OD area wells will not be sampled
32 while munitions removal activities are conducted (see Section 5.3.2).

- 34 • Collect quarterly groundwater elevation data from all existing and active monitoring
35 wells.

- 1 • Collect groundwater samples from active monitoring wells using the methods
2 described in Section 4.2 and submit groundwater samples for specific chemical
3 analyses.
- 4
- 5 • Containerize and manage purge water as investigation-derived waste (IDW)
6 following the procedures outlined in Section 4.5.

7 **1.3 Work Plan Organization**

8 This 2013 Interim Measures Facility-Wide GMP is organized as follows:

- 9
- 10 • **Section 2**—Presents the available site history and general description of the FWDA
11 facility and summarizes previous groundwater investigations.
- 12
- 13 • **Section 3**—Presents the current site conditions and environmental setting of the
14 FWDA.
- 15
- 16 • **Section 4**—Details the procedures for groundwater sample collection,
17 decontamination, quality assurance, and IDW characterization and disposal.
- 18
- 19 • **Section 5**—Discusses the groundwater monitoring program objectives, data
20 validation, data management, and reporting.
- 21
- 22 • **Section 6**—Provides the projected sampling schedule for CY 2013/2014.
- 23

2. SITE HISTORY AND BACKGROUND

2.1 General Description

The FWDA (Facility) currently occupies approximately 24 square miles (15,277 acres) of land in western New Mexico in McKinley County (Figure 2-1). The FWDA is located approximately 7 miles east of Gallup and about 130 miles west of Albuquerque. The main entrance to the FWDA is on U.S. Highway 66, west from Exit 33 off Interstate 40. The Facility is surrounded by federally owned and administered lands, including national forests, Zuni tribal lands, and Navajo tribal lands. North and west of the FWDA are Navajo trust and Native American allotted lands, to the east are lands that are administered by the Bureau of Indian Affairs, and to the south and southeast is the undeveloped Cibola National Forrest.

Originally founded in 1860 as a cavalry post, the U.S. Army established Fort Wingate as a munitions storage depot in 1918. The FWDA installation has had a number of missions since then, including ordinance storage, testing, and demilitarization, as well as missile defense testing.

The installation was closed in 1993 under the Defense Authorization Amendments and Base Realignment and Closure (BRAC) Act of 1988. In 2002, the Army reassigned many functions at FWDA to the BRAC Division, including: property disposal, caretaker duties, management of caretaker staff, and performance of environmental restoration and compliance activities. Facilities at FWDA include approximately 500 concrete bunkers located throughout the post, two former open burn/open detonation (OB/OD) areas, a workshop area, and various mission-support service structures located in the administration area.

At the present, approximately half of the FWDA is leased to the Missile Defense Agency and is used for operations related to missile testing. The remaining FWDA operations are focused on assessment and remediation of contamination resulting from past military activities. Efforts to remediate affected areas have concentrated on the removal of exploded and unexploded ordnance, in addition to characterizing soil across the installation and conducting semi-annually groundwater monitoring. The installation can be divided into several areas based upon location and historical land use. These major land-use areas include the following (Figure 2-2):

- 1 • **The Administration Area**—Located in the northern portion of the installation and
2 encompasses approximately 800 acres; consists of former office facilities, housing,
3 equipment maintenance facilities, warehouse buildings, and utility support facilities.
4
- 5 • **The Workshop Area**—Located south of the Administration Area and encompasses
6 approximately 700 acres; consists of an industrial area containing former ammunition
7 maintenance and renovation facilities, the former trinitrotoluene (TNT) washout
8 facility, and the TNT Leaching Beds Area.
9
- 10 • **The Magazine (Igloo) Area**—Located in the central portion of the installation and
11 covers approximately 7,400 acres; consists of areas that encompass 10 Igloo Blocks
12 (A through H, J, and K) that contain 732 earth-covered igloos and 241 earthen
13 revetments previously used for munitions storage.
14
- 15 • **The OB/OD Areas**—Located within the southwest and western portions of the
16 installation; the OB/OD Area can be separated into two sub-areas based on period of
17 operation:
18
 - 19 – **Closed OB/OD Area**—Inactive OB/OD unit that was used to treat military
20 munitions and explosive-contaminated waste from 1948 to 1955; includes the Old
21 Burning Ground, the Demolition Landfill Area, and the Old Demolition Area
22 (PMC, 1999).
23
 - 24 – **Current OB/OD Area**—Inactive OB/OD unit where burning and detonation
25 operations were performed after 1955 until installation closure in 1993 (PMC,
26 1999); contains the OB/OD Unit Hazardous Waste Management Unit identified in
27 the Permit.
28
- 29 • **Protection and Buffer Areas**—Located adjacent to the eastern, northern, and western
30 boundaries of the installation and encompasses approximately 4,050 acres; consists of
31 buffer zones surrounding the former magazine and demolition areas.
32

33 At present, FWDA has been undergoing final environmental restoration prior to property
34 transfer/reuse. As part of the planned property transfer to the Department of Interior (DOI),
35 the installation has been divided into reuse parcels with each site being addressed on a
36 parcel-by-parcel basis, as specified by the Permit (NMED, 2005). Parcels transferred to-date
37 are located near the southern and eastern boundaries of the installation and consist of Parcels
38 1, 15, and 17.

2.2 Previous Groundwater Investigations

Environmental restoration activities at the FWDA began in 1989 under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) guidelines, as part of the Installation Restoration Program. The one exception was the OB/OD Area, which proceeded under RCRA guidelines. During the period from 1980 through issuance of the Permit in December 2005, a number of environmental investigations were conducted by the Army and other parties (e.g., U.S. Environmental Protection Agency [EPA] and DOI) under CERCLA and RCRA guidance (BRAC, 2010).

Since that time, NMED has become the lead regulatory agency, and in 2002, NMED determined that the remediation pathway would be solely through a RCRA permit for post-closure care of the OB/OD Area with a RCRA corrective action module attached to address requirements for other sites/parcels. The Permit (NMED, 2005) was finalized in December 2005 and became effective 31 December 2005. The 2005 RCRA permit identified one Hazardous Waste Management Unit within the current OB/OD unit (Parcel 3), and a total of 93 solid waste management units (SWMUs) and areas of concern (AOCs).

Since the 1980s, a number of groundwater investigations have been completed at the FWDA. Generally, these investigations have been conducted with multiple phases to iteratively characterize groundwater at a single location over a period of time. Currently, 104 groundwater monitoring wells have been installed to characterize the nature and extent of contamination from activities associated with the OB/OD unit and various SWMUs and AOCs. While a majority of the wells is sampled, some are dry (5), buried (3), damaged (1), or plugged and abandoned (10), and therefore, are not currently being sampled (Table 2-1).

Groundwater investigation and characterization efforts have primarily focused on five areas:

- TNT Leaching Beds Area (SWMU 1 located within Parcel 21),
- Administration Area (multiple SWMUs and AOCs located in Parcels 6, 7, and 11),
- Eastern Landfill Area (SWMU 13 located within Parcel 18),
- Buildings 542 and 600 Area (SWMUs 11 and 4 located within Parcel 6),
- and the OB/OD Area (located within Parcel 3).

For discussion purposes related to groundwater sampling, these areas have been grouped within two major areas at the Facility: the OB/OD Area and the Northern Area. A map showing all existing monitoring well locations is included as Figures 2-3 through 2-5, well construction information for all wells to date is included in Table 2-1, and a Microsoft Excel[®] spreadsheet of all groundwater analytical results to-date is included in Appendix C.

1 **2.2.1 Environmental Survey of FWDA - 1981**

2 In 1981, an environmental survey of FWDA (ESE, 1981) was conducted to determine the
3 potential presence and extent of contamination caused by activities related to munitions
4 storage, munitions recycling, and treatment. The following describes the activities related to
5 groundwater monitoring:

- 6
- 7 • Eleven monitoring wells (FW07, FW08, FW10, FW11, FW12, FW13, FW26, FW27,
8 FW28, FW29, and FW35) were completed in the Northern Area during this
9 assessment. However, groundwater was not encountered in the majority of the wells,
10 thus most of these wells are considered dry and have been abandoned.
- 11
- 12 • One monitoring well (FW24), located near a north-south trending arroyo that drains
13 into the OB/OD Area, was completed as part of the environmental survey of the
14 OB/OD Area in 1981. Upon completion of the installation of FW24, the well had
15 insufficient water for sampling and is considered dry and inactive.
- 16
- 17 • One background monitoring well, FW31, was completed east and south of any known
18 potentially contaminated areas during the 1981 environmental survey. This well is
19 near the former Pistol Range, over 10,000 feet southeast of the TNT Leaching Beds
20 Area, and over 14,000 feet northeast of the OB/OD Area. This well is active and is
21 currently being sampled on a semi-annual basis.
- 22

23 Unfortunately, most of the wells completed during the 1981 Environmental Survey have
24 historically lacked sufficient water for interim semi-annual sampling as directed by the
25 Permit.

26

27 **2.2.2 Groundwater Investigations at Building 6 UST Area – 1993-1995**

28 During January 1993, six underground storage tanks (USTs) were removed from Building 6
29 within the Administration Area (USACE, 1995a). During the removal, a fuel release was
30 suspected, presumably from holes or cracks in the bottoms of several of the tanks or
31 associated piping. This spill was discovered on 19 January and reported to the NMED,
32 Petroleum Storage Tank Bureau (USACE, 1995a).

33

34 The USACE, Albuquerque District, conducted a site investigation for the Building 6 USTs.
35 In 1993, 16 soil borings were advanced to an average depth of 60 feet below ground surface
36 (bgs). Based on the laboratory and field results from the 16 soil borings, the vertical extent of
37 the contamination appeared to be limited by a continuous clay layer occurring at

1 approximately 40 feet bgs. The horizontal extent of the soil contamination appeared to be
2 limited to within 250 feet downgradient of the former USTs. These results were submitted to
3 the NMED in June 1993. After reviewing these results, the NMED requested in January 1994
4 that the investigation be expanded to better define the vertical and horizontal extent of the
5 soil contamination and to determine if diesel products have significantly contaminated the
6 shallow alluvial aquifer.

7
8 In October and November 1994, six soil borings were advanced to a depth of 60 feet bgs, and
9 five monitoring wells were installed at three locations (MW-18S, MW-18D, MW-20, MW-
10 22S, and MW-22D). Groundwater analytical data from MW-20, located south and west of
11 the UST removal area, indicated benzene contamination of 110 micrograms per liter ($\mu\text{g/L}$),
12 well above the state action level of 10 $\mu\text{g/L}$ for benzene in groundwater. These monitoring
13 wells were resampled in December 1994, and laboratory analysis indicated that the same well
14 (MW-20) was still contaminated with benzene, but at a lower level of 59 $\mu\text{g/L}$. A soil gas
15 survey was conducted in the UST area in March 1995 to better define the location of the
16 benzene contamination in the vicinity of MW-20; however, benzene was not found in the soil
17 at depths between 35 to 50 feet in that area. The monitoring wells were also resampled
18 during the soil gas survey, and laboratory analytical data indicated that the benzene level in
19 MW-20 had decreased to 4.4 $\mu\text{g/L}$ (USACE, 1995b).

20
21 With the apparent steady decline in the benzene levels, the USACE, Albuquerque District,
22 approached the NMED to suspend the investigation and any further requirements to install
23 additional monitoring wells at this site. The NMED agreed that installation of additional
24 monitoring wells was not needed at that time, however, a 2-year quarterly groundwater
25 monitoring program was required to ensure that shallow groundwater quality has not been
26 compromised (USACE, 1995b).

27 28 ***2.2.3 Remedial Investigation/Feasibility Study Report and RCRA Corrective Action*** 29 ***Program Document - 1997***

30 Environmental investigation activities at FWDA were implemented as part of base closure in
31 the Fall of 1992 to determine the environmental impact (if any) from previously identified
32 SWMUs and AOCs, and to identify areas requiring environmental restoration prior to
33 property transfer to the DOI. Findings generated as a result of this effort were documented in
34 the 1997 Remedial Investigation/Feasibility Study Report and RCRA Corrective Action
35 Program Document (ERM PMC, 1997); a summary pertaining to the groundwater activities
36 and findings are discussed below.

- 1 • Four groundwater monitoring wells (TMW01 through TMW04) were completed
2 during 1996 to further characterize groundwater contamination near the TNT
3 Leaching Beds Area in the Northern Area. Monitoring wells TMW01, TMW03, and
4 TMW04 were completed between 60 and 75 feet bgs in the unconsolidated material
5 overlying the mudstone/sandstone bedrock. Monitoring well TMW02 was completed
6 to a depth of approximately 85 feet bgs into a sandstone water-bearing unit that
7 underlies the TNT Leaching Beds Area.
8
- 9 • A single well (SMW01) was installed in 1996 to monitor potential impacts from the
10 Sewage Treatment Plant also in the Northern Area. This well was completed in the
11 unconsolidated alluvium overlying the mudstone/sandstone bedrock located in the
12 most northern portion of the FWDA.
13
- 14 • A single well (FW38) was completed during November 1993 in an arroyo that drains
15 the Current OB/OD Area. This well was completed to approximately 7.5 feet bgs in
16 the unconsolidated alluvium overlying the mudstone/sandstone bedrock. This well is
17 currently dry and is considered inactive.
18

19 During this phase of investigation, explosives and nitrate were the primary constituents
20 detected in the monitoring wells completed near the TNT Leaching Beds Area. Nitrate,
21 pesticides, and metals were the primary constituents detected in the samples collected from
22 SMW01 near the FWDA sewage treatment plant. Explosives, nitrate/nitrite, and metals were
23 the primary constituents detected in groundwater samples collected from FW38.
24

25 ***2.2.4 Minimum Site Assessment Report -1998***

26 The purpose of the Minimum Site Assessment was to provide a summary of the actions taken
27 by the USACE, Albuquerque District, to identify the horizontal and vertical extent of soil
28 contamination and to determine if groundwater was impacted by potential fuel releases at the
29 UST site adjacent to Building 45.
30

31 The Minimum Site Assessment was initiated in November 1996 with the completion of six
32 soil borings (SB-1 through SB-6) and three shallow monitoring wells (MW01, MW02, and
33 MW03) to determine the extent of hydrocarbon contamination. Analytical data from this
34 assessment indicated that hydrocarbon contamination in the soil was limited to a small area.
35 The area affected was restricted to a single soil boring at depths less than 40 feet bgs.
36 Chemical characterization of underlying groundwater indicated minimal impact with a single
37 detection of benzene at a low concentration at MW01.
38

1 **2.2.5 RCRA Interim Status Closure Plan – OB/OD Area Phase 1B Report - 1999**

2 Environmental characterization efforts in support of closure at the OB/OD Area were
3 conducted during CYs 1996, 1997, 1998, and 1999. Overall, these efforts consisted of
4 monitoring well installation and sampling, a seismic profile survey, groundwater elevation
5 measurements, a well survey, geologic mapping, surface water sampling, and sediment
6 sampling (PMC, 1999).

7 The objective of the 1996 investigation was to assess the presence and quality of shallow
8 groundwater and to characterize the shallow hydrogeologic regime in the OB/OD Area. This
9 investigation consisted of drilling and sampling of multiple soil borings; completion of
10 shallow and intermediate depth monitoring wells; performance of down-hole video logging
11 and slug tests on newly installed monitoring wells; and collection of groundwater, surface
12 water, and sediment samples. Three groundwater monitoring wells (KMW09, KMW10, and
13 KWM11) were installed in the Closed OB/OD Area and eleven groundwater monitoring
14 wells (CMW02, CMW04, CMW06, CMW07, CMW10, CMW14, and CMW16 through
15 CMW20) were installed in the Current OB/OD Area. Explosive constituents were detected in
16 wells located in both OB/OD Areas; however, the areal extent could not be defined by the
17 CY 1996 investigation and required further characterization efforts.

18
19 Subsurface characterization measures were conducted during CY 1997 to obtain additional
20 data concerning the stratigraphy and structural setting of the OB/OD Area. This investigation
21 consisted of a surface seismic survey, geologic mapping, and fracture trace analysis. From
22 this and previous investigations, two groundwater systems within the OB/OD Areas were
23 identified: the shallow, unconsolidated water-bearing zone and the deeper, bedrock water-
24 bearing zone (PMC, 1999).

25
26 In 1998, two groundwater monitoring wells (KMW12 and KMW13) were installed within
27 the Closed OB/OD Area, and four groundwater monitoring wells (CMW21, CMW22,
28 CMW23, and CMW25) were installed north of monitoring well CMW16 located in the
29 current OB/OD Area to identify the northern extent of impacted groundwater within the
30 unconsolidated and bedrock water-bearing zones. In addition, CMW24, was installed
31 northwest of CMW16 to determine if previously identified faults act as a groundwater flow
32 barrier or conduit, and to determine the direction of groundwater flow in that area (PMC,
33 1999).

34
35 **2.2.6 OB/OD Groundwater Monitoring – 1999 to 2005**

36 Several quarterly sampling events have been completed in the OB/OD Areas since the
37 issuance of the 1999 RCRA Interim Status Closure Plan - Phase 1B Report (PMC, 1999).

1 Quarterly groundwater monitoring events were conducted during CYs 2000 (PMC, 2001a),
2 2001 (PMC, 2002a), and 2002 (PMC, 2003), and an additional sampling event was
3 completed in August 2005 (TerranearPMC, 2005). These quarterly events were documented
4 in quarterly letter reports and an annual inclusive report for each year.

5
6 During the initial sampling investigation, a subset of nine wells (CMW02, CMW16,
7 CMW18, CMW21, CMW22, CMW25, KMW09, KMW12, and KMW13) was sampled
8 during the CY 2000 and the first half of the CY 2001. Monitoring well CMW23 was added
9 midway through CY 2001, and a subset of 10 wells was sampled until CY 2005.

10 11 **2.2.7 RCRA Facility Investigation Report of the TNT Leaching Beds Area - 2001**

12 From 1998 to 2001, additional groundwater investigations were completed in the TNT
13 Leaching Beds Area and the Administration Area (PMC, 2001b). Seven groundwater
14 monitoring wells (TMW05 through TMW08, TMW10, TMW11, and TMW13) were
15 installed to further characterize the hydrogeologic setting and potential environmental
16 impacts caused by the former operations. As a result of these investigations, groundwater
17 was found to be impacted by explosives, metals, nitrate, and nitrite, which appear to emanate
18 from the TNT Leaching Beds Area. In addition, groundwater was also found to be impacted
19 by pesticides and solvents, which appear to originate from the Administration Area.

20 21 **2.2.8 Phase 1 RCRA Facility Investigation Report for Buildings 600 and 542 - 2002**

22 In 2001, soil and groundwater were investigated to determine if previous detections of
23 explosives in TMW11 were the result of activities at Buildings 600 and 542 (Ammunition
24 Workshop) (PMC, 2002b).

25
26 Monitoring well TMW11, drilled in a location cross-gradient from the TNT Leaching Beds
27 Area, was intended to provide groundwater chemical characterization data in an area thought
28 to be unimpacted by historical operations. One explosive constituent,
29 cyclotrimethylenetrinitramine (1,3,5-trinitro-1,3,5-triazinane or RDX), was detected at
30 concentrations close to the laboratory method detection limit (MDL) during five of six
31 sampling events conducted between October 1998 and January 2000. These detections of
32 RDX initiated an investigation to identify other potential sources of explosives in the area.

33
34 A total of six monitoring wells (TMW14A through TMW19) were completed near
35 Buildings 542 and 600 to determine the source of the contamination at TMW11. Monitoring
36 well TMW15 was completed in the unconsolidated water-bearing zone, similar to TMW11.
37 Monitoring wells TMW14A, TMW16, TMW17, TMW18, and TMW19 were completed in

1 the deeper, sandstone bedrock water-bearing zone. TMW14A was also installed as a potential
2 background well.
3 Overall, only low concentrations of a single volatile organic compound (VOC), explosives,
4 perchlorate, nitrate, nitrite, and a variety of metals were detected from samples collected
5 during this investigation.

7 ***2.2.9 Groundwater Investigation Report of the Eastern Landfill - 2005***

8 The Eastern Landfill is located approximately ½ mile northeast of the water towers and is
9 reported to have been used for the disposal of garbage, trash, and debris from the
10 Administration Area, and for the burning of other solid waste from activities at the FWDA.
11 In 1968, the landfill was closed and covered with a layer of soil. During the Remedial
12 Investigation (RI) phase, the Eastern Landfill was located using a geophysical survey, and
13 soil sampling and a soil gas survey were conducted. The soil analytical results indicated that
14 lead, mercury, and barium were present at levels slightly above background levels.
15 Pesticides, VOCs and semi-volatile organic compounds (SVOCs) were not detected. The
16 results of the soil gas survey indicated that low levels of methane were present; however,
17 hydrogen sulfide gas was not detected. In October 1999, Safe Environment, Inc. removed
18 surface debris in the area of the Eastern Landfill, which consisted of metal ammunitions lids,
19 wire rope, I-beams, pipe, tires, wire fencing, concrete blocks, expended ammunition casings,
20 scrap wood, and tree branches/trunks (TtNUS, 2005).

21
22 The primary objective of the 2005 groundwater investigation was to determine if
23 contaminants have impacted the groundwater beneath the Eastern Landfill (TtNUS, 2005).
24 During the investigation, four bedrock wells (EMW01 through EMW04) were completed to
25 depths ranging from 100 to 120 feet bgs in 2004. Immediately after installation, only two of
26 the four wells (EMW02 and EMW03) contained enough water for sampling (TtNUS, 2005).
27 Several explosives, metals, pesticides, VOCs, SVOCs, nitrate, and nitrite were detected in
28 these samples collected from the sampling event after well installation.

30 ***2.2.10 Administration and TNT Leaching Beds Areas Supplemental Groundwater*** 31 ***Characterization Report - 2006***

32 The purpose of the work described in this report was to gather additional information during
33 2002 and 2003 to address comments and discussions by members of the FWDA BRAC
34 Cleanup Team regarding information presented in the 2001 Final RCRA Facility
35 Investigation (RFI) for the TNT Leaching Beds Area (TerranearPMC, 2006).

1 These prior discussions indicated that the downgradient flow of groundwater from the TNT
2 Leaching Beds Area to the north could possibly be split by the influence of a groundwater
3 mound that has been shown to exist within the Administration Area. In this scenario,
4 impacted groundwater could flow to the west-northwest and/or to the northeast around the
5 Administration Area, thus the existing monitoring wells, TMW06 and TMW07, would not be
6 properly placed to define the downgradient extent(s) of impacted groundwater. Therefore,
7 additional monitoring wells were required to evaluate this scenario. In addition, the
8 groundwater analytical data presented in the TNT Beds RFI Report indicated that the leading
9 edge of impacted groundwater (as indicated principally by detected nitrite/nitrate
10 concentrations) had reached the edge of the permeable sediments of the Rio Puerco Valley.
11 Because groundwater from these sediments is used for domestic water supply in the
12 immediate vicinity of the FWDA, additional efforts (monitoring wells and groundwater
13 samples) were warranted to determine the current groundwater quality within the Rio Puerco
14 sediments in the northern areas of the FWDA.

15

16 As a result, nine monitoring wells (TMW21 through TMW29) were installed and screened
17 within the unconsolidated water-bearing zone. Upon completion of the new wells, a
18 groundwater sampling event of all wells in the Northern Area of FWDA was conducted
19 during October 2002 and April 2003. The results of this event were similar to those of the
20 2001 RFI Report of the TNT Leaching Beds Area and provided further information about the
21 leading edges of impacted groundwater.

22

23 ***2.2.11 Parcel 11 RCRA Facility Investigation Report - 2011***

24 In November and December of 2009, the U.S. Geological Survey (USGS) conducted a RFI
25 in Parcel 11. Three monitoring wells were installed within Parcel 11 at SWMU 5 (TMW35,
26 near Building 5), SWMU 6/AOC 47 (TMW34, west of Building 11), and SWMU 45 (USGS,
27 2011a). The SWMU 45 monitoring well (TMW33) was installed downgradient of former
28 UST locations near Building 6 (USGS, 2011a). All three monitoring wells were constructed
29 in the alluvium and in accordance with NMED guidance with the water table no less than 5
30 feet below the top of the screen.

31

32 Groundwater samples were collected in April 2010 during the scheduled semi-annual
33 groundwater monitoring activities. No diesel fuel constituents were detected, but VOCs and
34 nitrate were detected in samples with concentration above screening criteria. The screening
35 level for nitrate is 10 milligrams per liter (mg/L). TMW34 and TMW35 samples contained
36 nitrate at 177 mg/L and 84.5 mg/L, respectively (USGS, 2011a). Of the VOCs detected,
37 1,2-dichloroethane was detected in groundwater from TMW33 above the screening level of

1 5 µg/L. The groundwater sample collected from TMW33 had a 1,2-dichloroethane
2 concentration of 30.7 µg/L (USGS, 2011a).

3 4 **2.2.12 Parcel 22 RFI Report - 2011**

5 In November and December of 2009, the USGS installed six monitoring wells as part of the
6 RFI for Parcel 22 to investigate the suspected release of perchlorate originating from TPL,
7 Inc. (a former tenant) operations related to demilitarization of munitions within SWMU 27
8 (USGS, 2011b). Five of the monitoring wells were completed within the sandstone water-
9 bearing unit (TMW30, TMW31D, TMW32, TMW36, and TMW37), and one monitoring
10 well was installed in alluvium (TMW31S). In addition, TMW31S and TMW31D were
11 installed as dual-completion wells (two monitoring wells constructed in one borehole).
12 TMW30 was a replacement monitoring well for TMW05 (dry since 2008), and TMW31S
13 was installed as a replacement monitoring well for FW10, which is also dry.

14
15 Groundwater samples were collected in April 2010 during the scheduled semi-annual
16 groundwater monitoring activities. Groundwater samples collected from monitoring wells
17 TMW30, TMW31D, and TMW31S contained nitrate above the screening level of 10 mg/L
18 with concentrations of 89.1 mg/L, 59.0 mg/L, and 35.0 mg/L, respectively (USGS, 2011b).
19 Groundwater samples collected from monitoring wells TMW30, TMW31D, TMW31S, and
20 TMW32 contained perchlorate concentrations exceeding the screening level of 6 micrograms
21 per liter (µg/L) with concentrations of 1,900 µg/L, 1,420 µg/L, 465 µg/L, and 232 µg/L,
22 respectively (USGS, 2011b).

23 24 **2.2.13 Monitoring Well Installation and Abandonment Work Plan - 2011**

25 The purpose of this work plan is to describe the work performed by the USGS on behalf of
26 the USACE, Fort Worth District, as part of the Environmental Restoration Program at
27 FWDA. The plan describes the installation of up to 18 groundwater monitoring wells and the
28 abandonment of 10 groundwater monitoring wells. This work was performed to further
29 delineate groundwater contaminant plumes, establish background concentration levels,
30 monitor potential off-site migration, and remove from service several dry monitoring wells
31 (USGS, 2011c).

1 Wells were installed at locations selected to address one of the following three objectives:

- 2
- 3 1) To monitor potential off-site migration of chemical constituents originating from
- 4 former post activities
- 5
- 6 2) To determine background concentrations of major and trace metals
- 7
- 8 3) To add sufficient spatial data to further define the RDX, nitrate, and perchlorate
- 9 groundwater plumes
- 10

11 **Well Installation**

- 12 • **Sentinel Wells** - Two alluvial sentinel monitoring wells (MW23 and MW24) were
- 13 installed in June and July 2011 at the request of the NMED. These two wells are
- 14 located in the northwest portion of the FWDA and were selected to monitor potential
- 15 off-site migration of chemical constituents within the alluvial aquifer (USGS, 2011c).
- 16
- 17 • **Background Wells** - Three background monitoring wells (BGMW01, BGMW02, and
- 18 BGMW03) were installed in February 2012 in the alluvial aquifer to determine the
- 19 background concentrations of major and trace metals in the groundwater. The purpose
- 20 of these wells is to determine the natural concentrations of constituents that reflect the
- 21 naturally occurring water-rock interactions with the alluvial unit, as well as
- 22 atmospheric inputs, clay mineralogy, pH, and water chemistry (USGS, 2011c).
- 23
- 24 • **Perchlorate Plume Monitoring Wells** - Alluvial monitoring wells (TMW39S,
- 25 TMW40S, TMW41) were installed in July and September 2011 to aid in delineating
- 26 the lateral extent of the perchlorate plume. Three bedrock monitoring wells (TMW38,
- 27 TMW39D, and TMW40D) were also installed to define the lateral extent of the
- 28 bedrock perchlorate plume (USGS, 2011c).
- 29
- 30 • **RDX Plume Monitoring Wells** - Three alluvial monitoring wells (TMW43, TMW44,
- 31 and TMW45) were installed in the Northern Area in February 2012. Monitoring
- 32 wells, TMW43 and TMW44, were installed to refine the concentration gradient in the
- 33 center of the RDX plume and to allow for contaminant mass discharge estimates.
- 34 These monitoring wells will also aid in defining the concentration gradient of nitrate
- 35 in the alluvium, which comingles with the RDX plume. Monitoring well TMW45 was
- 36 installed north of TMW23 to delineate the northern extent of the RDX plume (USGS,
- 37 2011c).
- 38

- **Nitrate Plume Monitoring Wells** - Two alluvial monitoring wells (TMW46 and TMW47) were installed in February 2012 to provide chemical data that will delineate the northwest and eastern boundaries of the alluvial nitrate plume. Additionally, because the nitrate alluvial plume comingles with the RDX plume and alluvial perchlorate plume, monitoring wells installed to characterize these plumes will also be used to further characterize the alluvial nitrate plume (USGS, 2011c).

Well Abandonment

Ten groundwater monitoring wells were plugged and abandoned in the summer of 2011 because these wells historically lacked sufficient groundwater volumes required for groundwater sampling. These 10 wells were all located in the Northern Area and were generally screened within the alluvium. The following list dictates which wells were plugged and abandoned:

Well ID	Northing ^a	Easting ^a	Casing Diameter (inches)	Well Depth (feet)
TMW05	1639949.83	2498884.78	2.0	37.40
FW07	1640839.18	2498075.06	4.0	30.50
FW08	1640572.50	2498132.47	4.0	51.00
FW10	1640848.95	2498936.89	4.0	51.50
FW11	1641334.02	2499124.16	4.0	28.00
FW12	1641609.82	2499038.13	4.0	29.00
FW13	1641688.39	2498830.01	4.0	30.50
FW27	1646461.42	2494395.93	4.0	32.00
FW28	1646584.14	2493050.57	4.0	33.00

2.2.14 Semi-Annual RCRA Groundwater Monitoring Reports and Updated Groundwater Monitoring Plans - Ongoing

In accordance with Section V.A of the Permit (NMED, 2005), the 2008 Interim Measures Facility-Wide GMP was prepared, approved by NMED, and implemented. Since 2008, groundwater sampling was conducted semi-annually (April and October), and semi-annual groundwater monitoring reports were prepared, providing the analytical data and water level maps for FWDA.

1 In addition, the Interim Measures Facility-Wide GMP is updated annually and is required to
2 propose changes to the groundwater monitoring program annually. Section 5 provides the
3 proposed changes to the 2013/2014 monitoring program.
4

3. SITE CONDITIONS

The general information below is a summary of the site conditions at the FWDA. More specific information including historic land use, natural and man-made features, ecological setting, fate and transport information, and detailed surface and subsurface characterization will be included in other documents (e.g., RFI Work Plans and Release Assessment Reports) prepared for the individual parcels as specified in the Permit.

3.1 Climate

Northwestern New Mexico is characterized by a semi-arid, continental climate with most precipitation occurring during the months of May through September as localized, heavy, and brief monsoon storms. The climate for the FWDA area varies with elevation but is generally mild during the summer with temperatures ranging between 65 and 95 degrees Fahrenheit (°F), and cold during the winter with average daily temperatures ranging between 30 and 35°F. The warmest month of the year is July with an average maximum temperature of 89°F, while the coldest month of the year is December with an average minimum temperature of 11°F. Daily temperature variations can be considerable during the summer months with an average temperature difference of approximately 35°F.

Mean annual rainfall for the area ranges between 10 and 16 inches, while the recorded average annual precipitation for the FWDA is approximately 11 inches. The wettest month of the year is August with an average rainfall of approximately 2 inches. Most of the precipitation occurs as rain or hail during violent summer thunderstorms; the remainder results from light winter snow accumulations with the slow release of spring snowmelt, which provides higher infiltration compared to the intense monsoon thunderstorms (Anderson *et al.*, 2003).

The area has generally sunny weather with average relative humidity varying from 50 to 15 percent during the wet season (summer monsoons) and the dry season, respectively. During spring, the area experiences very strong winds originating from the west and southwest with an average wind speed of approximately 12 miles per hour and maximum gust speeds approaching 65 miles per hour. These strong winds, high temperatures, and low relative humidities contribute to high evaporation rates at the FWDA.

1 **3.2 *Topography***

2 Topographically, the FWDA can be divided into three areas: (1) the rugged north-south
3 trending Nutria Monocline (commonly referred to as the Hogback) along the western and the
4 southwestern boundaries of the installation; (2) the northern hill slopes of the Zuni Mountain
5 Range in the southern portion of the installation; and (3) the alluvial plains marked by
6 bedrock remnants in the northern portion of the installation. The elevation of FWDA ranges
7 from approximately 8,200 feet above mean sea level in the south to 6,660 feet above mean
8 sea level in the north.

9
10 This climate and topography supports a mixed ponderosa pine and fir forest at elevations
11 above 7,500 feet, piñon and juniper vegetation at elevations from 7,500 to 6,800 feet, and
12 shrubs and grasses at elevations below 6,800 feet.

13
14 **3.3 *Soil***

15 The FWDA soil types range from a mixture of sand, silt, and clay. Alluvium most commonly
16 found in arroyos is permeable sand and sandy loam clay mixtures that contain varying
17 amounts of silt, gravel, and rock fragments; however, most soil across the Facility is
18 composed of low-permeability sandy clay. Soil types at the FWDA are primarily alluvial
19 materials with the exception of the Hogback along the western border and the northern hill
20 slopes of the Zuni Mountain Range in the southern portion of the installation. The alluvial
21 materials do not have distinct soil horizons as they are relatively shallow and undeveloped,
22 excluding the arroyos, and the parent bedrock is either at or near the surface within more than
23 a quarter of the installation.

24
25 High winds and water cause extensive soil erosion, especially where the vegetation cover is
26 absent. The more permeable, sandy soil typically found in arroyos accounts for the majority
27 of local surface-water infiltration. The thickness of the soil varies across the installation. In
28 the OB/OD Area and at the eastern and southern perimeter of the Northern Area, the soil
29 thickness is a thin veneer with parent bedrock at or near the surface. However, in the majority
30 of the Northern Area, the flat alluvial plains are dominant with thick soil overlying deeper,
31 steeply dipping bedrock. In the Administration Area alone, alluvium can be up to 70 feet
32 thick and are even thicker near the Rio Puerco.

33

1 **3.4 Geology**

2 **3.4.1 Regional Geology Tectonic Setting and Site-Specific Structure**

3 The FWDA is located in an erosional basin within the Navajo section of the Colorado
4 Plateau Physiographic Province and lies on the northwest apex of the Zuni Uplift. This basin
5 is regionally bounded by the Gallup Sag to the west, the Acoma Sag and McCarty’s Syncline
6 to the east, and the Chaco Slope to the north. The Zuni Uplift is an elongated north-northwest
7 trending structural uplift that is primarily a result of vertical upward displacement followed
8 by deformation resulting from horizontal compressive stress associated with the Laramide
9 Orogeny (Cretaceous). The uplift has exposed tilted Mesozoic sedimentary strata within the
10 south-western portion of the installation, a majority of which are Triassic mudstones and
11 sandstones.

12

13 Specifically, the dominant topographic structural feature located on the southwest margin of
14 the Zuni Uplift is the Nutria Monocline or “Hogback.” This steep structural feature is a
15 monoclinal belt with dips ranging from 30 to 45 degrees near the Facility. Dips commonly
16 exceed 60 degrees in the southern extension of the monocline, south of the Facility. The
17 northern segment of the Nutria Monocline is exposed in the western portion of the FWDA,
18 where westerly dipping Mesozoic strata is exposed to form a long, sharp-crested, north-to-
19 south trending ridge. In areas of the installation east of the Hogback, the bedrock generally
20 dips to the northwest.

21

22 **3.4.2 Stratigraphy**

23 In the northern portion of the installation, the surface is covered by either remnants of the
24 Chinle Group (Triassic) or alluvial deposits (Quaternary). The majority of the alluvial
25 deposits are mostly prevalent in the Northern Area in lowland areas between bedrock
26 remnants. Alluvial deposits are also present along intermittent streams draining the Hogback
27 and Zuni Mountains, which flow downgradient through the northern portion of the
28 installation before joining the South Fork of the Puerco River. The alluvium ranges in grain
29 size from clay to gravel, typical of braided stream deposits (Malcolm Pirnie, Inc., 2000).
30 Because the alluvium was generally deposited by braided streams and arroyos, the texture
31 and internal structure are characterized by lateral and vertical heterogeneity. Information
32 obtained from records of previously installed wells indicates that the alluvial deposits are
33 thickest near major drainages, such as the South Fork of the Rio Puerco, where alluvial
34 deposits can be up to 150 feet thick. Near Fort Wingate High School (located east of the
35 installation), the alluvial deposits are approximately 75 feet thick, whereas in the

1 **3.4 Geology**

2 **3.4.1 Regional Geology Tectonic Setting and Site-Specific Structure**

3 The FWDA is located in an erosional basin within the Navajo section of the Colorado
4 Plateau Physiographic Province and lies on the northwest apex of the Zuni Uplift. This basin
5 is regionally bounded by the Gallup Sag to the west, the Acoma Sag and McCarty’s Syncline
6 to the east, and the Chaco Slope to the north. The Zuni Uplift is an elongated north-northwest
7 trending structural uplift that is primarily a result of vertical upward displacement followed
8 by deformation resulting from horizontal compressive stress associated with the Laramide
9 Orogeny (Cretaceous). The uplift has exposed tilted Mesozoic sedimentary strata within the
10 south-western portion of the installation, a majority of which are Triassic mudstones and
11 sandstones.

12
13 Specifically, the dominant topographic structural feature located on the southwest margin of
14 the Zuni Uplift is the Nutria Monocline or “Hogback.” This steep structural feature is a
15 monoclinal belt with dips ranging from 30 to 45 degrees near the Facility. Dips commonly
16 exceed 60 degrees in the southern extension of the monocline, south of the Facility. The
17 northern segment of the Nutria Monocline is exposed in the western portion of the FWDA,
18 where westerly dipping Mesozoic strata is exposed to form a long, sharp-crested, north-to-
19 south trending ridge. In areas of the installation east of the Hogback, the bedrock generally
20 dips to the northwest.

21
22 **3.4.2 Stratigraphy**

23 In the northern portion of the installation, the surface is covered by either remnants of the
24 Chinle Group (Triassic) or alluvial deposits (Quaternary). The majority of the alluvial
25 deposits are mostly prevalent in the Northern Area in lowland areas between bedrock
26 remnants. Alluvial deposits are also present along intermittent streams draining the Hogback
27 and Zuni Mountains, which flow downgradient through the northern portion of the
28 installation before joining the South Fork of the Puerco River. The alluvium ranges in grain
29 size from clay to gravel, typical of braided stream deposits (Malcolm Pirnie, Inc., 2000).
30 Because the alluvium was generally deposited by braided streams and arroyos, the texture
31 and internal structure are characterized by lateral and vertical heterogeneity. Information
32 obtained from records of previously installed wells indicates that the alluvial deposits are
33 thickest near major drainages, such as the South Fork of the Rio Puerco, where alluvial
34 deposits can be up to 150 feet thick. Near Fort Wingate High School (located east of the
35 installation), the alluvial deposits are approximately 75 feet thick, whereas in the

1 Administration Area, deposit thickness is variable with average thickness varying from 30 to
2 70 feet within a relatively small spatial area.

3
4 The majority of the FWDA is underlain by the Chinle Group (Triassic), which is
5 predominantly non-marine, red-bed siliciclastics. The Chinle Group consists of the
6 Shinarump, Bluewater Creek, Petrified Forest, and the Owl Rock Formations. The Petrified
7 Forest Formation directly underlies the majority of the installation, and is subdivided into
8 three members: the Blue Mesa, the Sonsela, and the Painted Desert Members. All three
9 members of the Petrified Forest Formation outcrop in various locations across the
10 installation. The Blue Mesa, Sonsela, and Painted Desert lithologies are green-gray smectitic
11 mudstone, light-gray to yellowish-brown cross-bedded sandstone, and reddish-brown and
12 grayish-red smectitic mudstone, respectively. At the eastern extent of the FWDA installation,
13 the older Bluewater Creek and Shinarump Formations outcrop intermittently between
14 Quarternary alluvium.

15
16 The Chinle Group is underlain by the older San Andres Limestone and Glorieta Sandstone,
17 both Permian in age. The San Andres Limestone generally consists of fossiliferous limestone
18 that intertongues the Glorieta Sandstone (Anderson *et al.*, 2003). These two formations do
19 not outcrop within the boundaries of the Facility; however, the Glorieta Sandstone Formation
20 does outcrop south of the installation where a thrust fault juxtaposes Permian strata against
21 the Cretaceous Dakota Sandstone.. These two formations comprise the San Andres-Glorieta
22 aquifer and is the principal source of drinking water in the area (Malcolm Pirnie, Inc., 2000).
23 Figure 3-1 depicts the geology of the FWDA.

24 25 **3.5 Surface Water**

26 **3.5.1 General Surface Water**

27 Streams are ephemeral and fed by rain and snowmelt from the Zuni Mountain Range and the
28 Nutria Monocline. All drainages in the FWDA area are intermittent with flow only occurring
29 during and after heavy rainfall events (summer) or snowmelt (spring). These streams
30 transport sediment to low-lying areas in the northern portion of the installation, thus creating
31 thick and extensive alluvial deposits among remnants of Triassic strata of the Petrified Forest
32 Formation. Main drainages at the FWDA generally follow the dominant topography, flowing
33 from south to north and discharging into the South Fork of the Rio Puerco in the northern
34 portion of the installation. Because of the nature of brief and heavy precipitation in this semi-
35 arid region, the surface drainage is relatively shallow near headwaters. Downward erosion
36 intensifies as the water moves downstream, thus resulting in a well-developed, steep-walled
37 system of arroyos in Quaternary alluvium.

1 **3.5.2 Site-Specific Surface Water**

2 Three major drainage systems at the FWDA can be identified as follows: (1) eastern drainage
3 system; (2) western drainage system; and (3) southwestern-corner drainage system. These
4 drainage systems are divided by either bedrock ridges or bedrock remnants. Furthermore, in
5 the northwest portion of the site, two artificial channels are present that were constructed
6 during the 1940s to divert water away from Igloo Blocks A and B and the Administration
7 Area (U.S. Department of Energy, 1990).

8

9 The eastern drainage system consists of washes that run in northwestern and northeastern
10 directions off the slopes of the Zuni Mountains. Alluvial fans form in basins at the front of
11 the slope, as well as between bedrock remnants. In the northeast section of the installation,
12 the drainage flows around bedrock remnants before joining the South Fork of the Puerco
13 River. The western drainage system (except for the southwest corner) consists primarily of
14 two main drainages covering the western portion of the FWDA. Tributaries of the western
15 drainage system pass the demolition area, cross the Hogback, and then join, flowing north
16 depositing alluvium along the bedrock remnants (Herndon Solutions Group, 2011). The
17 southwestern-corner drainage system flows southwest and joins the Bread Springs Wash on
18 the western side of the Hogback. Because the southwestern drainage system is
19 hydrogeologically isolated from the other parts of the site and installation activities have
20 apparently not occurred in this area, the drainage system is of less environmental concern
21 (U.S. Department of Energy, 1990).

22

23 **3.6 Hydrogeology**

24 Groundwater is present in several of the rock units underlying FWDA. Examination of these
25 units and records of wells in the area indicates that the only formations at FWDA capable of
26 yielding more than a few gallons per minute (gpm) are the Quatowam Alluvium (Quaternary)
27 and the San Andres Limestone and Glorieta Sandstone (Permian). However, minor amounts
28 of groundwater are present in bedrock underlying the shallow alluvial aquifer and are
29 composed of Triassic-age Members of the Chinle Group: the Painted Desert
30 Mudstone/Claystone, the Shinarump Conglomerate, and the Sonsella Sandstone. Water
31 yields from the Shinarump and Sonsella Members generally yield 5 to 50 gpm, and the water
32 quality is considered fair to poor. Water-bearing formations of Jurassic and Cretaceous ages
33 capable of yielding 100 gpm or more are present 4 to 6 miles to the west of FWDA, but not
34 within installation boundaries. The tilted bedrock underlying the majority of the FWDA
35 installation dips gently to the northwest, which substantially influences the movement of
36 groundwater. The groundwater flow gradient in the Northern Area is primarily to the south-

1 southwest in the alluvial system and to the west in the bedrock system. The groundwater flow
2 gradient appears to be in a northerly direction in the OB/OD area.

4 **3.6.1 Productive Aquifers**

5 The Quaternary alluvial aquifer, which includes deposits in the Rio Puerco Valley along the
6 northern edge of the installation, is composed of gravel, sand, silt, and clay derived from
7 Triassic and Jurassic age strata that border the valley. This shallow aquifer is primarily
8 recharged from surface runoff, although some deposits in the southern part of the installation
9 are recharged by springs from underlying bedrock aquifers. Recharge of groundwater within
10 the alluvium occurs mainly during the wet seasons of the year, specifically with the
11 snowmelt in the spring.

12
13 The San Andres-Glorieta aquifer is the only groundwater source for FWDA installation and
14 outcrops near the installation's southern boundary, dipping to the north. Snowmelt and
15 precipitation furnish much of the recharge water to the aquifer. The downgradient flow of
16 groundwater is in a northwesterly direction with the top of the San Andres-Glorieta aquifer
17 approximately 1,100 feet bgs near the Administration Area. At this location, the aquifer is
18 about 200 feet thick and under artesian pressure. Local variations in aquifer permeability can
19 be large and unpredictable with hydraulic conductivity values ranging from 0.05 to 150 feet
20 per day and yields that are highly variable from one location to another (USACE, 2011). In
21 1980, the region around Gallup, including FWDA, was declared an underground water basin
22 by the State of New Mexico. This action prohibits any major new groundwater withdrawals
23 without the approval of the State Engineer. The recharge basin for this aquifer covers
24 approximately 1,439 square miles and includes the communities of Gallup, Fort Wingate,
25 Camerco, Mariano Lake, Navajo Wingate Village, and Rehoboth (USACE, 2011).

27 **3.6.2 OB/OD Area Hydrogeology**

28 The general groundwater flow in the OB/OD Area is from south to north, following the
29 general topographic gradient (Herndon Solutions Group, 2011). Groundwater in the OB/OD
30 Area is mostly present in Triassic-age bedrock (Herndon Solutions Group, 2011) from the
31 Chinle Group. According to data presented in monitoring well logs, the majority of
32 monitoring wells in the OB/OD Area are constructed in undifferentiated Chinle units or the
33 Sonsela Member of the Petrified Forest Formation. Because groundwater is generally not
34 present in the alluvial deposits, groundwater can saturate the sediments that load arroyos
35 generally only during and after substantial precipitation. Monitoring wells CMW20 and
36 FW38 are constructed in arroyo sediment. FW38 is a dry well, and CMW20 only periodically
37 contains sufficient groundwater to sample (Herndon Solutions Group, 2011).

1 **3.6.3 Northern Area Hydrogeology**

2 In the northern portion of the installation, the alluvium is thicker than in the OB/OD Area,
3 thus has a higher storage capacity for groundwater. Saturated thickness within the alluvial
4 aquifer (Quatowam Alluvium) varies greatly and tends to increase as it nears drainage
5 channels and arroyos. The direction of general groundwater flow is from the north toward the
6 south. However, directly beneath the Administration Area, groundwater flow from the north
7 converges with groundwater flow from the southern edge of the Workshop Area. This
8 convergence creates a local westerly groundwater flow direction (Herndon Solutions Group,
9 2011).

10
11 In addition, groundwater is also present in bedrock beneath the Workshop Area in
12 discontinuous fine-grained, sandstone beds within the Painted Desert Member of the Petrified
13 Forest Formation. Several monitoring wells are constructed with screens in these sandstones,
14 and groundwater elevation measurements indicate that the downgradient is in a westerly
15 direction (Herndon Solutions Group, 2011).

16
17 **3.7 Cultural Resources**

18 Traditional Cultural Properties and other cultural resources have been documented within
19 FWDA boundaries. Existing groundwater monitoring wells and access routes are not located
20 within identified archaeological sites. Because groundwater sampling activities are non-
21 intrusive and confined to a small area immediately surrounding a given well, cultural
22 resource monitoring will not be required during proposed sampling activities at existing
23 wells.

24
25 Maps showing the locations of Traditional Cultural Properties relative to existing monitoring
26 well locations will not be included in this Interim Measures Facility-Wide GMP, which will
27 be a public document when final.

4. SITE MONITORING AND SAMPLING METHODS

Field activities to be performed under this Interim Measures Facility-Wide GMP include groundwater elevation surveys and collection of groundwater samples from the monitoring wells at FWDA. The various types of purge methods required for sampling are identified in Table 4-1 and described in the following sections. Field equipment required for the following field activities is listed in Table 4-2. The Site Safety and Health Plan for this investigation is included in Appendix D.

4.1 Groundwater Elevation Survey

Groundwater elevation measurements in the existing wells listed in Table 4-1 will be measured quarterly over a two-day period (January, April, July, and October). When a groundwater elevation survey event coincides with a groundwater sampling event, water elevation data shall be collected prior to the start of sample collection.

Depth to groundwater shall be measured with an electronic water-level meter as follows:

- Slowly lower the probe of the water-level meter down into the well casing in order to minimize groundwater disturbance.
- Record measurement to the nearest 0.01 foot from the top-of-casing reference notch and document in field logbook.
- Remove water level probe from the well casing and decontaminate with Liquinox[®] and deionized water as described in Section 4.4. Use of any other type of detergent will be documented in the field logbooks and investigative reports.

4.2 Groundwater Sampling

Groundwater will be sampled from the monitoring wells listed in Table 4-1 in order of increasing chemical concentration (known or anticipated) and analyzed for the constituents of interest outlined in Section 5.3. Sample bottles will be filled in the following order:

Analytical Group	Analytical Method	Container (Number, Size, and Type)
TCL VOCs	8260C	(3) - 40 mL VOC glass vials
TCL SVOCs	8270D	(1) - 1-L am`ber bottle
TPH-GRO	8015B	(3) - 40 mL VOC glass vials

Analytical Group	Analytical Method	Container (Number, Size, and Type)
TPH-DRO	8015B	(1) - 1-L amber bottle
Explosives	8330B	(2) - 1-L amber bottles
Nitrate	300.0	(1) - 250-mL poly bottle
Nitrite	300.0	(1) - 500-mL poly bottle
Perchlorate	6860	(1) - 250-mL poly bottle
Pesticides	8081A	(2) - 1-L amber bottle
Total Metals and Mercury (unfiltered)	6010C/6020B/7470A	(1) - 1-L poly bottle
Dissolved Metals and Mercury (filtered)	6010C/6020B/7470A	(1) - 1-L poly bottle

- 1 L = liter
- 2 mL = milliliter
- 3 SVOC = semi-volatile organic compound
- 4 TCL = target compound list
- 5 TPH-DRO = total petroleum hydrocarbon - deisel range organics
- 6 TPH-GRO = total petroleum hydrocarbon - gasoline range organics
- 7 VOC = volatile organic compound

8

9 Sampling of the monitoring wells at FWDA involves a variety of purging and sampling
10 methods. Use of a low-flow pump (described in Section 4.2.2) is the preferred method at
11 FWDA and the NMED guidance document on low-flow sampling should be referenced when
12 groundwater sampling is being conducted (NMED-HWB, 2001). However, due to low yield,
13 some wells require one of the alternative methods described in Section 4.2.4. All water
14 generated during purging activities, as well as the excess groundwater from sampling, will be
15 collected in 5-gallon buckets or equivalent and managed as IDW following procedures
16 described in Section 4.5.

17

18 Table 2-1 contains well construction data, including, top-of-casing and ground surface
19 elevation data for calculation of well volumes. Monitoring wells that do not contain water are
20 identified as dry.

21

22 **4.2.1 Preliminary Site Activities**

23 **4.2.1.1 Initial Inspection**

24 Upon arrival at each monitoring well, the wellhead and exposed casing will be inspected for
25 evidence of tampering or other damage. Observations will be recorded in the field logbook,
26 and the USACE Contracting Officer Representative (COR) will be notified of any vandalism
27 or damage. Once initial inspection is complete, preventative measures will be employed at
28 the site to reduce risk of contamination. Plastic sheeting or other materials such as absorbent
29 pads will be placed around each wellhead to prevent contamination of sampling equipment
30 and/or ground surface. A staging area will be designated for equipment decontamination to

1 include cleaning solutions, brushes, 5-gallon buckets, and plastic sheeting or absorbent pad,
2 as appropriate.

4 4.2.1.2 *Measure Initial Water Level and Calculate Well Volume*

5 Prior to purging and sampling, the depth to groundwater shall be measured from the top-of-
6 casing reference notch and recorded to the nearest 0.01 foot by following the procedure
7 described in Section 4.1. The well volume will be calculated using the measured groundwater
8 level and casing dimensions in the following formula:

$$\begin{aligned} & [\pi \times (\text{filter pack radius (inches)})^2 \times \text{height of filter pack (inches)}] + \\ & [\pi \times (\text{well casing radius (inches)})^2 \times (\text{height of water in casing above annual seal (inches)})] = \\ & \text{well volume (inches}^3\text{)} \times 0.0043 = \text{well volume (gallons)} \end{aligned}$$

13
14 Groundwater elevation and well volume calculations will be recorded in the field logbook
15 and/or on the Low-Flow Sampling Data Form (Appendix E) as appropriate.

17 4.2.2 *Low-Flow Pump Purging*

18 Two types of dedicated, adjustable rate, low-flow pumps constructed of stainless steel and/or
19 Teflon[®] and polyethylene are installed in select wells as listed in Table 4-1. Sampling
20 methods for these pumps, identified as either traditional low-flow pumps or Zone Isolation
21 Sampling System (ZIST) low-flow pumping systems, are described in the following sections.
22 Refer to Table 4-2 for the list of required field equipment.

23
24 In a traditional low-flow pump, the pump intake is located approximately 2 feet from the
25 bottom of the screened interval to ensure collection of formation water and to minimize
26 mobilization of particulates present in the bottom of the well.

27
28 The ZIST pumping system is used in wells that cannot be purged by the traditional low-flow
29 technique due to extremely low recharge rates. The system utilizes a low-flow pump and
30 mechanical packers, which isolate the screened interval to ensure the sampling of formation
31 water only. Below the mechanical packer assembly is a solid 1.5-inch diameter cylinder
32 extending the length of the screened interval that reduces the volume of required purge water.
33 Pumping rates at each well having a ZIST assembly will be determined prior to the sampling
34 event to ensure that the pumping rate does not cause drawdown of the water column.

35
36 Because the low-flow pumps are dedicated (traditional and ZIST) and will remain in place
37 between sampling events, approximately 1 liter of water (or more, depending on pump

1 installation depth/length of discharge tubing and volume of water contained in tubing) will be
2 purged to clear any stagnant water from the pump and discharge tubing.

3
4 **4.2.2.1 Traditional Low-Flow Pump**

5 Drawdown and final pump cycle setting information from previous sampling event(s)
6 (Appendix C) will be checked for each well. The extraction rate of the previous sampling
7 event(s) will be duplicated to the extent practical. The following steps will be performed for
8 purging with traditional low-flow pumps.

- 9
- 10 1) Start pump at the lowest speed setting and slowly increase until discharge occurs.
- 11
- 12 2) Measure the water level again.
- 13
- 14 3) Adjust pump speed until there is little or no water level drawdown. Once water
15 quality readings are stabilized (step nine), the established water level drawdown must
16 not be more than 4 inches/0.33 feet.
- 17
- 18 4) Begin purging well to previously determine volume.
- 19
- 20 5) Monitor and record water level, purge volume, and purging rate approximately every
21 2 to 5 minutes during purging.
- 22
- 23 6) Make any necessary adjustments to pumping rates within the first 15 minutes of
24 purging. Reduce pumping rates as needed to the minimum capabilities of the pump
25 (for example, 30 to 400 milliliters per minute with at least 40 milliliters per pump
26 cycle) to ensure stabilization of indicator parameters. Keep the water level above the
27 well screen. If the static water level is above the well screen, avoid lowering the water
28 level into the screen if possible.
- 29
- 30 7) Record all adjustments to pumping rate (both time and flow rate).
- 31
- 32 8) During well purging, monitor the following field parameters and
33 record (approximately every 2 to 5 minutes) on the Low-Flow Sampling Data Form
34 (Appendix E).
- 35
- 36 – Turbidity
- 37 – Temperature
- 38 – Specific conductivity

- 1 – Hydrogen ion activity (pH)
- 2 – Dissolved oxygen
- 3 – Oxygen reduction potential
- 4 9) Purging is considered complete and sampling will begin when the field parameters
- 5 have stabilized (or if stabilization has not occurred after 30 minutes of purging).
- 6 Stabilization has occurred when three consecutive readings are within the following
- 7 limits:

Parameter	Units	Stabilization Criteria
Temperature	°C	± 10%
pH	SU	± 0.5
Specific Conductivity	mS/cm	± 10%
Dissolved Oxygen	mg/L	10% (dissolved oxygen levels less than 1.0 mg/L fall within the margin of error limits)
Turbidity	NTU	± 10% for values greater than 1 NTU
Oxygen reduction potential	mV	± 10 mV
Water Level	feet	0 to 0.33 foot drawdown (or 4 inches)

8 °C = degrees Celsius
9 mg/L = milligram per liter
10 mS/cm = millisemen per centimeter
11 mV = millivolts
12 NTU = Nephelometric Turbidity Unit
13 SU = Standard Unit

14
15
16 All measurements, except turbidity, will be obtained using a transparent flow-through-cell
17 that prevents air bubble entrapment in the cell. Field personnel will watch for particulate
18 build-up within the cell, which may affect the transient field parameter values. This build-up
19 may affect field parameter values measured within the cell, and may also cause an
20 underestimation of turbidity values. If the cell needs to be cleaned during purging operations,
21 pumping will continue, and the cell will be disconnected and rinsed with deionized water to
22 remove sediment. The flow-through-cell will then be reconnected and monitoring activities
23 will continue. Water should not be allowed to drain out of the flow-through-cell when the
24 pump is turned off or cycling on/off. Field personnel will ensure that the monitoring probes
25 remain submerged in water at all times with the exception of the time spent cleaning
26 particulate build-up in the flow-through-cell.

27
28 **4.2.2.2 ZIST Low-Flow Pump**

1 Extraction rates from the initial pump setup are located on sample collection logs from
2 previous sampling events and will be duplicated to the extent practical. The following steps
3 will be performed for purging with ZIST low-flow pumps.

- 4
- 5 1) Start the pump at the predetermined extraction rate and allow to purge until discharge
6 occurs.
- 7
- 8 2) Measure water level during the purging process to ensure that drawdown of the water
9 column does not occur. If drawdown occurs, this will indicate that the mechanical
10 packer system has failed and the ZIST will need to be removed, inspected, and
11 repaired before continuing.
- 12
- 13 3) Begin purging well to previously determine volume.
- 14
- 15 4) Monitor and record water level and purging rate approximately every 2 to 5 minutes
16 during purging.
- 17
- 18 5) During well purging, monitor the following field parameters as described in Section
19 4.2.2.1 and record (approximately every 2 to 5 minutes) on the Low-Flow Sampling
20 Data Form (Appendix E).
- 21

22 **4.2.3 Groundwater Sample Collection by Low-Flow Pump**

23 Following stabilization of field parameters, groundwater samples will be collected according
24 to the steps listed below. Sample collection will follow a constituent sampling order
25 determined prior to initiating field activities with sample bottles for VOC and SVOC
26 analyses filled first.

- 27
- 28 1) During sampling activities, maintain the pump at approximately the same flow rate
29 during purging and stabilization of field parameters.
- 30
- 31 2) Monitor depth-to-water to ensure that the water level does not drop more than 0.33
32 feet from the established pumping level.
- 33
- 34 3) Disconnect the flow-through-cell.
- 35
- 36 4) Field personnel handling sample bottles will wear disposable latex or nitrile gloves.
- 37

- 1 5) Collect samples directly from the pump discharge tubing (not from the flow cell
2 discharge tubing) by allowing the discharge to flow gently down the inside of the
3 sample container in order to minimize turbulence.
4
- 5 6) The discharge tubing will remain filled with water during sampling to minimize
6 possible changes in water chemistry caused by contact with the atmosphere. If the
7 discharge tubing is not completely filled, a clamp or connector (Teflon® or stainless
8 steel) will be added to constrict the sampling end of the tubing, or the flow rate will
9 be increased slightly until the water completely fills the tubing. Small-diameter tubing
10 for the groundwater discharge line will be used to help ensure discharge tubing
11 remains filled with liquid when operating at very low pumping rates.
12
- 13 7) Fill sample containers in the predetermined order listed in Section 4.2, with
14 containers for VOC and SVOC analyses filled first.
15
- 16 8) To collect groundwater samples for dissolved metals analysis, place a 0.45-micron
17 filter on the pump discharge tube and allow 100 mL of sample water to flow through
18 the filter as a pre-rinse. After pre-rinsing, fill a specified preserved sample container
19 with the filtered groundwater.
20
- 21 9) For collecting the groundwater sample for perchlorate, use a pre-rinsed 0.40-micron
22 filter to fill a sterile, non-preserved container. Run 100 mL of filtered sample water
23 through a 0.20-micron filter as a pre-rinse for the 0.20-micron filter. After the pre-
24 rinse, fill the perchlorate container with the twice-filtered sample water. This step
25 may need to be repeated as necessary in order to fill the perchlorate sample container.
26
- 27 10) After filling each sample container, immediately seal, label, and place container into
28 an iced cooler according to the sample management procedures discussed in Section
29 4.3.
30
- 31 11) Decontaminate the pump after completion of sampling at each monitoring well as
32 described in Section 4.4.
33
- 34 12) Manage all liquid and solid IDW as described in Section 4.5.
35
36

1 **4.2.4 Alternative Groundwater Purging and Sampling Procedures**

2 Some wells at FWDA require alternative methods of purging and sampling due to extremely
3 low yield/low water level. For these wells, purging and sampling are performed with one of
4 the following: disposable bailers, a 12-volt-battery pump, or a dedicated Bennett pump. The
5 methods and type of equipment required for purging and sampling are identified for each
6 well in Table 4-1 and will be recorded on the individual sample log for each well.

7
8 These procedures emphasize the need to remove a sufficient volume of water from each well
9 to ensure that the sampled groundwater is representative of the surrounding formation.

10 Removal of a quantity of water equal to three times the calculated volume of standing water
11 in the well (including the saturated annulus) will be completed wherever possible. See
12 Section 4.2 for calculation of well volume.

13
14 Field parameters will be monitored at a time interval determined by the purge rate, and
15 values will be recorded on the sample collection form (Appendix E). Stabilization of field
16 parameters is used to indicate that conditions are suitable for sampling to begin. Purging is
17 considered complete and sampling will occur under one of the three following scenarios:

- 18
19 • Before three well volumes have been evacuated, three consecutive readings of the
20 field parameters are recorded within the limits listed in Section 4.2.2.1, thus
21 indicating that stabilization has occurred. Discontinue purging and, if the recovery
22 rate is rapid, allow the monitoring well to recover to its original volume prior to
23 sample collection.
24
25 • After evacuation of three well volumes and if the field parameters have not stabilized,
26 discontinue purging, collect samples, and provide a full explanation of attempts to
27 achieve stabilization.
28
29 • The monitoring well is emptied before three well volumes can be evacuated due to
30 very slow recovery. Ensure that a minimum of three field parameter readings have
31 been collected. Obtain groundwater samples as soon as the monitoring well has
32 recharged to sufficient volume, which typically occurs the following day. It may take
33 several days to collect the full suite of parameters.

34
35 **4.2.4.1 Disposable Bailers**

36 The following steps describe purging and collecting groundwater samples with disposable
37 bailers.

- 1) Securely attach nylon cord to the bailer, carefully lower the bailer into the monitoring well, and allow bailer to fill with groundwater.
- 2) Raise bailer out of the monitoring well and empty purge water into a 5-gallon bucket designated for IDW.
- 3) Repeat process until the calculated volume of groundwater has been purged from the monitoring well (3 times the well volume).
- 4) Discard the bailer used for purging and prepare a new bailer for sample collection.
- 5) Collect samples with the disposable bailer in the same manner as purging. Allow the groundwater discharge to flow gently from the bailer down the inside of the sample container via the sampling port at the bottom of the bailer to minimize turbulence.
- 6) Fill sample containers in the predetermined order listed in Section 4.2 with containers for VOC and SVOC analyses filled first.
- 7) To collect bailed groundwater samples for dissolved metals and/or perchlorates analysis, filter sample with a pre-rinsed 0.45-micron filter using the peristaltic pump and dedicated tubing into a specified preserved sample container (pre-rinsed with at least 100 mL of sample water).
- 8) After filling each sample container, immediately seal, label, and place container into an iced cooler according to the sample management procedures discussed in Section 4.3.
- 9) All disposable materials, including disposable bailers used for sampling and the collected purge water, will be managed as IDW as described in Section 4.5.

4.2.4.2 Grundfos Redi-Flo2 Pump

A Grundfos Redi-Flo2 submersible pump, or equivalent, will be used in monitoring wells where no dedicated pump is present and sufficient water is available to maintain a water level above the head capacity. The Grundfos pump will also be used to purge wells where sufficient water is available but recharge is poor (i.e. pump dry). Procedures for purging and collection groundwater samples with a Grundfos are as follows:

- 1) Attach clean unused polyethylene tubing to the top of the decontaminated Grundfos pump and secure the tubing with an appropriately sized hose clamp.
- 2) Lower the Grundfos pump into the well and take care not to agitate the water column. Attach nylon ties every 10 feet around the hose and lead line.
- 3) Very carefully touch the well bottom with the pump. Based on the well completion information, slowly raise the pump to just above the bottom of the screened interval.
- 4) Secure the tubing and lead line to the well head using nylon ties or equivalent, attach the discharge line to the flow through cell, and complete the circuit from the control box to the portable generator.
- 5) Energize the control box and begin the purge. Water will start to flow up the tubing at about 250HZ for a 65 foot well.
- 6) Establish a consistent flow rate of between 1 to 2 gallons per minute using a stop watch and a graduated cylinder. Discharge the calculated volume of purge water into 5-gallon bucket(s), as appropriate.
- 7) During well purging, monitor and record the transient field parameters as described in section 4.2.2.1 (once per well volume evacuated from well). Also document whether a static water-level can be achieved from well recharge, or if the purge will completely evacuate the well volume.
- 8) When purging is complete, remove the flow-through-cell to collect groundwater sample directly from the pump discharge tube. Allow the groundwater to flow gently from the discharge tube down the inside of the sample container to minimize turbulence.

If the well has been purged dry, allow for recharge and collect samples via a disposable bailer (see section 4.2.4.1 for sample procedures).
- 9) Fill sample containers in the predetermined order listed in Section 4.2 with containers for VOC and SVOC analyses filled first.
- 10) To collect groundwater samples for dissolved metals analysis, place a 0.45-micron filter on the pump discharge tube and fill a specified preserved sample container

1 with the filtered groundwater. Allow for 100mL of groundwater to flow through
2 the filter as a pre-rinse prior to sample collection.

3
4 11) For collecting the groundwater sample for perchlorate, use a pre-rinsed 0.40-
5 micron filter to fill a sterile, non-preserved container. Run 100 mL of filtered
6 sample water through a 0.20-micron filter as a pre-rinse for the 0.20-micron filter.
7 After the pre-rinse, fill the perchlorate container with the twice-filtered sample
8 water. This step may need to be repeated as necessary in order to fill the
9 perchlorate sample container.

10
11 12) After filling each sample container, immediately seal, label, and place container
12 into an iced cooler according to the sample management procedures discussed in
13 Section 4.3.

14
15 13) Decontaminate the pump after completion of sampling at each monitoring well as
16 described in Section 4.4.

17
18 14) Remove and dispose of the polyethylene tubing after completion of
19 sampling/purging at each monitoring well. Manage all liquid and solid IDW as
20 described in Section 4.5.

21 **4.2.4.3 Bennett Sample Pump**

22 Dedicated Bennett sample pumps are used in cases where the depth to water in a monitoring
23 well is too deep to use disposable bailers. The Bennett pump system consists of a piston
24 activated with pressurized nitrogen gas through a Teflon[®] tube, a second Teflon[®] tube that
25 returns groundwater to the surface, and a third Teflon[®] tube for gas exhaust. Monitoring
26 wells at FWDA equipped with Bennett pumps are identified in Table 4-1. The Bennett pump
27 intake was placed approximately 2 feet from the bottom of the monitoring well. Procedures
28 for using a Bennett pump to purge and collect groundwater samples are as follows:

- 29
- 30 1) Connect the air intake tubing from the dedicated pump to the the pressurized nitrogen
31 cylinder. Connect the discharge tubing to the flow-through-cell.
 - 32
 - 33 2) Turn on gas flow from the nitrogen cylinder. Use initial pumping rate of
34 approximately 4 gpm. For the last 15 to 20 feet of the water column, reduce pumping
35 rate to approximately 1 gpm. Discharge the calculated volume of purge water into a
36 5-gallon bucket(s) or tank, as appropriate.
 - 37

- 1 3) Monitor and record all adjustments to pumping rate.
- 2
- 3 4) During well purging, monitor and record the transient field parameters as described in
- 4 Section 4.2.2.1 (approximately every 2 to 5 minutes).
- 5
- 6 5) When purging is complete, remove the flow-through-cell to collect samples from the
- 7 discharge tubing. Allow the groundwater to flow gently from the discharge tube down
- 8 the inside of the sample container to minimize turbulence.
- 9
- 10 6) Fill sample containers in the predetermined order listed in Section 4.2 with containers
- 11 for VOC and SVOC analyses filled first.
- 12
- 13 7) To collect groundwater samples for dissolved metals analysis, place a 0.45-micron
- 14 filter on the pump discharge tube and allow 100 mL of sample water to flow through
- 15 the filter as a pre-rinse. After pre-rinsing, fill a specified preserved sample container
- 16 with the filtered groundwater.
- 17
- 18 8) For collecting the groundwater sample for perchlorate, use a pre-rinsed 0.40-micron
- 19 filter to fill a sterile, non-preserved container. Run 100 mL of filtered sample water
- 20 through a 0.20-micron filter as a pre-rinse for the 0.20-micron filter. After the pre-
- 21 rinse, fill the perchlorate container with the twice-filtered sample water. This step
- 22 may need to be repeated as necessary in order to fill the perchlorate sample container.
- 23
- 24 9) After filling each sample container, immediately seal, label, and place container into
- 25 an iced cooler according to the sample management procedures discussed in Section
- 26 4.3.
- 27
- 28 10) Manage all liquid and solid IDW as described in Section 4.5.

30 **4.2.5 Post-Sampling Activities**

31 Upon completion of groundwater sampling, the nondedicated sampling equipment will be
32 removed from the well, and the final depth to groundwater will be measured from the top-of-
33 casing reference notch and recorded to the nearest 0.01 foot. Reusable measurement and
34 sampling equipment will be decontaminated prior to leaving the site, and all disposable
35 materials and purge water collected during sampling activities will be removed from the site
36 and treated as IDW following procedures outlined in Section 4.5. The monitoring well will
37 be secured prior to leaving the site.

38

1 **4.3 Sample Management Procedures**

2 **4.3.1 Sample Identification**

3 Each sample will be assigned a unique sample identification (ID) number. Groundwater
4 samples will be identified by the well number followed by the collection date (mmyyyy)
5 (e.g., TMW07042011 for sample from TMW07 on 20 April 2011). Quality control (QC)
6 samples such as field duplicate and quality assurance (QA) samples (described in Section
7 4.6) will have the same ID number as the parent sample and followed by DUP (i.e.,
8 duplicate), triplicate (TRP), matrix spike (MS), or matrix spike duplicate (MSD), as
9 appropriate. Equipment rinsate blanks and trip blanks will carry the designation EQUXXX
10 and TRIPXXX (XXX representing the sequence number of the sample), respectively.

11
12 **4.3.2 Chain-of-Custody Documentation**

13 Chain-of-custody documentation will be completed in the field to document sample
14 collection, possession, and the chain of custody. Data on the forms will include the sample
15 ID, tracking number, date sampled, time sampled, project name, project number, and
16 signatures of those in possession of the sample. A sample is considered to be in a person's
17 custody while either under physical custody or safely secured in a controlled access location.
18 Sample custody can be transferred by signature relinquishment and acceptance. The shipping
19 company waybills or bills of lading are considered part of the custody record between the
20 time of collection and receipt at the analytical laboratory. Chain-of-custody records will
21 accompany the sample until receipt at the analytical laboratory.

22
23 **4.3.3 Packaging and Shipping**

24 All samples will be packed and shipped by overnight air freight to the analytical laboratory
25 by the end of the collection day. Unless otherwise indicated, samples will be treated as
26 nonhazardous environmental samples, shipped in heavy-duty coolers, packed with materials
27 such as bubble wrap, bubble bags, or foam blocks to prevent breakage, and preserved with
28 ice in sealed plastic bags. Custody seals will be affixed to the non-hinged side of the lid of
29 each cooler. The custody seals will be signed and dated by a sample team member. Each
30 shipment will include the appropriate field QC samples. Corresponding chain-of-custody
31 forms will be placed in waterproof bags and taped to the inside of the coolers lids. Sample
32 shipments containing VOC samples will contain at least one trip blank.

33
34 **4.4 Decontamination**

1 Non-dedicated measurement and sampling equipment such as water-level tapes and
2 submersible pumps will be decontaminated prior to and after each use. Equipment
3 decontamination will follow the methods described below.

4
5 Sampling equipment dedicated for use at specific wells, i.e., Bennett sample pumps, will not
6 require decontamination prior to use. Disposable sampling equipment that is used once and
7 then disposed of will not require decontamination prior to use, provided that it is wrapped in
8 the manufacturer's packaging or otherwise protected from inadvertent contamination prior to
9 use.

10 11 **4.4.1 Decontamination Materials**

12 **4.4.1.1 Specifications for Decontamination Solutions**

13 Specifications for standard cleaning materials referred to in this section are as follows:
14

- 15 • A standard brand of phosphate-free laboratory detergent, such as Liquinox[®] obtained
16 from a laboratory supply distributor, will be used for decontaminating reusable
17 equipment. Use of any other type of detergent will be documented in the field
18 logbooks and investigative reports.
- 19
20 • Deionized water will be used for rinsate and decontamination and may be purchased
21 from local vendors
- 22
23 • Laboratory detergent and deionized water used to clean equipment will not be reused
24 during field decontamination.
- 25
26 • Used decontamination liquids will be properly containerized and managed as IDW, as
27 described in Section 4.5.

28 **4.4.1.2 Containers for Decontamination Solutions**

29 Improperly handled cleaning solutions may easily become contaminated. Storage and
30 application containers must be constructed of the proper materials to ensure their integrity.
31 The following are acceptable materials used for containing the specified cleaning solutions:
32

- 33 • Detergent solution is kept in clean plastic, metal, or glass containers until used; it is
34 poured directly from the container during use.

1 Deionized water is kept in clean tanks, hand-held sprayers, or squeeze bottles.

2
3 **4.4.1.3 Safety Procedures for Decontamination Operations**

4 Some of the materials used to implement the cleaning procedures outlined in this section can
5 be harmful if used improperly. Caution should be exercised by all field personnel and all
6 applicable safety procedures should be followed. At a minimum, the following precautions
7 will be observed in the field during decontamination operations:

- 8
- 9 • Safety glasses with splash shields or goggles and latex or nitrile gloves will be worn
10 during all cleaning operations.
 - 11
 - 12 • No eating, smoking, drinking, chewing, or any hand-to-mouth contact shall be
13 permitted during cleaning operations.

14
15 **4.4.2 Decontamination Operations**

16 A decontamination area will be established at Building 34. The basic steps for
17 decontamination are as follows:

- 18
- 19 1) If necessary, remove particulate matter or debris using a brush or hand-held sprayer
20 filled with deionized water.
 - 21
 - 22 2) Scrub the surfaces of the equipment using deionized water and Liquinox[®] solution
23 and a second brush made of inert material.
 - 24
 - 25 3) Rinse the equipment thoroughly with deionized water.
 - 26
 - 27 4) Place the equipment on a clean surface and allow to air dry.
 - 28
 - 29 5) Containerize all decontamination liquids and manage as IDW, as described in
30 Section 4.5.

31
32 After decontamination operations, equipment will be handled only by personnel wearing
33 clean gloves to prevent re-contamination. The equipment will be moved away from the
34 cleaning area to prevent re-contamination. If the equipment is not to be immediately re-used,
35 it will be covered with plastic sheeting or wrapped in aluminum foil to prevent re-
36 contamination. The area where the equipment is stored prior to re-use will be free of
37 contaminants.

1 **4.5 Waste Management Procedures**

2 As required by federal and state law, liquid IDW samples from the 2008 and 2010
3 groundwater sampling events were submitted to an analytical laboratory to determine
4 hazardous waste characteristics. Results from analytical testing showed that liquid IDW
5 generated during these sampling events was non-hazardous. Therefore, purge water and
6 decontamination water associated with the existing monitoring wells at the FWDA will be
7 managed and disposed of by the procedures described below. These procedures apply only to
8 the monitoring wells and sampling activities included in this Interim Measures Facility-Wide
9 GMP.

10
11 Three types of groundwater IDW may be generated during the groundwater sampling events
12 at FWDA: purge water and excess sample water from monitoring wells, decontamination
13 liquids (non-hazardous soap and water), and solid waste (disposable sampling equipment and
14 personal protective equipment).

15
16 Purge water, decontamination water, and other non-hazardous liquid IDW will be
17 containerized at the sample site in clean buckets and/or tanks with a watertight lid.
18 Depending upon the volumes generated, water from multiple wells may be consolidated into
19 one or more containers. At the end of the sampling day, the filled IDW containers will be
20 emptied into one of two low-density-polyethylene-lined evaporation tanks. The evaporation
21 tanks are located at the former Building 542 in Parcel 6.

22
23 All solid waste such as disposable sampling equipment, personal protective equipment, and
24 general refuse shall be placed in plastic trash bags. Small quantities of waste will be disposed
25 of in trash containers (dumpsters) located in the Administration Area at FWDA; large
26 quantities of waste material will be transported off site for disposal as municipal waste.

27
28 **4.6 Quality Assurance Procedures**

29 **4.6.1 Field Equipment Calibration and Preventative Maintenance**

30 Field instruments will be calibrated, operated, and maintained in accordance with the
31 manufacturer's instructions. Daily, on-site field instrument calibrations will be performed
32 before and during each day's use by trained technicians using certified standards. Instrument
33 calibrations will be recorded in bound logbooks dedicated to calibration data and will include
34 field instrument identification, date of calibration, standards used, and calibration results (as
35 described in Section 4.6.3.1).

36

1 If an individual suspects an equipment malfunction, the meter will be removed from service
2 and tagged so that it is not used inadvertently, and a substitute piece of equipment will be
3 used. Additionally, equipment that fails calibration or becomes inoperable during use will be
4 removed from service and tagged. Such equipment will be repaired and satisfactorily re-
5 calibrated. The results of activities performed using equipment that has failed re-calibration
6 will be evaluated. If the results are adversely affected, the outcome of the evaluation will be
7 documented, and the USACE COR will be notified. Equipment that cannot be repaired will
8 be replaced. Back-up equipment will be available in the field for use in case of a malfunction.

9
10 Preventative maintenance procedures for the field instruments will be carried out in
11 accordance with procedures outlined by the manufacturer's equipment manuals. All records
12 of inspection and maintenance will be dated and documented in the appropriate field
13 logbook. Critical spare parts for field instruments will be included in the sampling kits to
14 minimize downtime. In addition, back-up meters will be available, if needed. Spare parts will
15 be purchased from accepted vendors. Daily inspections of field equipment will be conducted
16 to ensure that equipment is functioning properly. If inspection results indicate that a piece of
17 field equipment is deemed faulty or not useable, replacement equipment will be cleaned,
18 calibrated if necessary, and used in place of the faulty equipment. The faulty equipment will
19 then be shipped back to the vendor for repair.

20 21 **4.6.2 Sample Collection Quality Assurance**

22 Several types of field QC samples will be submitted to the analytical laboratory to assess the
23 quality of the data resulting from the field sampling program. These samples will include
24 field duplicate samples, trip blanks, equipment rinsate blanks, field blanks, and MS and MSD
25 samples.

26
27 Field duplicate and QA split samples will be collected at a frequency of one per 10
28 environmental samples. Field equipment rinsate blanks are collected at a frequency of one
29 per 20 environmental samples, or at least one per sampling event, on non-dedicated
30 equipment.

31
32 Each shipment that contains samples of aqueous VOC analyses will contain a trip blank. The
33 trip blank will be placed in a cooler containing VOC samples and will stay with the cooler
34 until the cooler is returned to the analytical laboratory. Additional volume will be collected at
35 specified sample locations so that one MS/MSD pair will be submitted to the laboratory for
36 every 20 environmental samples.

1 **4.6.3 Documentation Quality Assurance**

2 Field documentation shall consist of one or more job- or area-specific field logbooks, field
3 forms, sample chains of custody, and sample logs/labels. Photographic documentation is not
4 required.

5
6 **4.6.3.1 Logbooks**

7 Site and field logbooks provide a daily handwritten record of all field activities. All logbooks
8 will be permanently bound and have a hard cover. Logbooks will be ruled, or ruled and
9 gridded, with sequentially numbered pages. All entries into field logbooks will be made with
10 indelible ink. Field logbooks are detailed daily records that are kept in real time and are
11 assigned to specific activities, positions, or areas within the site. Separate logbooks shall be
12 used for each sampling and field team.

13
14 Documentation in field notebooks will include the following (as necessary):

- 15
- 16 • Location
 - 17 • Date and time
 - 18 • Names of field crew
 - 19 • Names of subcontractors
 - 20 • Weather conditions during field activity
 - 21 • Sample type and sampling method
 - 22 • Location of sample
 - 23 • Sample ID number
 - 24 • Sample description (such as color, odor, clarity)
 - 25 • Amount of sample
 - 26 • Field measurements
 - 27 • Equipment specifications
 - 28 • Depth to groundwater
 - 29 • Decontamination and health and safety procedures
 - 30 • Sampling notes (such as well condition, unexpected maintenance, work stoppage,
31 etc.)
- 32

33 A separate logbook dedicated to calibration records will be maintained to include the
34 following information:

- 35
- 36 • Calibration results

- 1 • Adverse trends in instrument calibration behavior
- 2 • Field instrument identification, date of calibration, and standards used

3

4 If entries in the field notebooks need to be corrected or changed, corrections will be made by
5 crossing out mistakes with a single line, writing the corrections, and initialing and dating the
6 entry. The use of correction fluid is not permitted. At the conclusion of each day in the field,
7 the sampling team leader will review each page of the logbook for errors and omissions. The
8 sampling team leader will then date and sign each reviewed page.

9

10 **4.6.3.2 Field Data Record Forms**

11 In addition to the field notebooks, various forms are used to document field efforts
12 (Appendix E). These forms ensure that all required data and observations are recorded in a
13 consistent manner. No blank spaces will be left; all non-applicable items will be marked “not
14 applicable” (N/A). Forms that will be used include chain-of-custody forms and well sampling
15 forms (Appendix E).

16

17 **4.6.3.3 Final Evidence File Documentation**

18 All evidential file documentation will be maintained under an internal project file system.
19 The USACE COR will ensure that all project documentation and QA records are properly
20 stored and retrievable.

21

1 **5. MONITORING AND SAMPLING PROGRAM**

2 **5.1 *Monitoring and Sampling Program***

3 This section of the Interim Measures Facility-Wide GMP discusses the objectives for the
4 groundwater monitoring program, the corresponding DQOs, the rationale for the
5 groundwater monitoring program design, and a summary of the monitoring program for both
6 the OB/OD Area and the Northern Area.

8 **5.2 *Data Quality Objectives***

9 DQOs are qualitative and quantitative statements that clarify the project objectives, specify
10 the most appropriate type of data for the project decisions, determine the most appropriate
11 conditions from which to collect data, and specify tolerable limits on decision errors. DQOs
12 are developed to satisfy the specific project objectives in accordance with applicable USACE
13 specifications, NMED and EPA guidance; and are based on the end uses of data determined
14 through a seven-step process as described in EPA QA/G-4 (EPA, 2006) discussed below.

15 The DQO statements derived from the output of each step of the DQO process shall perform
16 the following:

- 17
- 18 • Clarify the study objective
- 19
- 20 • Define the most appropriate type of data to collect
- 21
- 22 • Determine the most appropriate conditions from which to collect data
- 23
- 24 • Specify acceptance levels of decision errors that will be used as the basis for
- 25 establishing the quantity and quality of data needed to support the decision.
- 26

27 DQOs are management tools used to develop a scientific and resource-effective sampling
28 design. The DQOs assist in identifying the required type, quality, and quantity of data
29 needed to support engineering and scientific evaluations, and withstand scientific and legal
30 scrutiny. The DQO process must be initiated during project planning to produce
31 investigations that result in data having a quantifiable degree of certainty.

1 **5.2.1 Data Quality Objective Process**

2 DQOs are based on the end uses of the data and are determined through a seven-step process
3 as described in EPA QA/G-4 (EPA, 2006).

4 • **Step 1 - State the Problem**

5 The purpose of this step is to clearly define the problem that requires new
6 environmental data so the study focus will be clear and unambiguous.

7 • **Step 2 - Identify the Decision**

8 This step involves the identification of the decision/objective that requires new
9 environmental data. Key activities associated with this step include the following:

- 10 – Identifying the key objective for the current phase or stage of the project
- 11 – Identifying alternative actions that may be taken based on the findings of the field
12 investigation
- 13 – Identifying relationships between this objective and any other current or subsequent
14 objectives

15 • **Step 3 - Identify Inputs to the Decision**

16 The purpose of this step is to identify the information needed to support the objective
17 and specify which inputs require new environmental measurements. Key activities
18 associated with this step include the following:

- 19 – Identifying the informational inputs needed to resolve the objective
- 20 – Identifying sources for each informational input and listing those inputs that are obtained
21 through environmental measurements
- 22 – Defining the basis for establishing contaminant-specific action levels
- 23 – Identifying potential sampling approaches and appropriate analytical methods

24 The outputs that will result from this step include a list of informational inputs needed
25 to make the specified decision and a list of environmental variables or characteristics
26 that will be measured. The outputs from this step are actually the inputs that will be
27 used to support the objective, sometimes referred to as the “decision.”

1 • **Step 4 - Define Boundaries of the Study**

2 This step requires the definition of spatial and temporal aspects of environmental
3 media that the data must represent to support the objective. Key activities associated
4 with this step include the following:

- 5 – Defining the geographic areas of the field investigation
- 6 – Defining each environmental medium of concern
- 7 – Dividing each medium into strata having relatively homogeneous characteristics
- 8 – Defining the scale of decision making (this is the smallest area, volume, or time frame of
9 the medium) in which the scoping team wishes to control decision errors
- 10 – Determining the time frame to which the objective applies
- 11 – Determining when to take samples
- 12 – Identifying practical constraints that may hinder sample collection (reconsider previous
13 steps as necessary)

14 • **Step 5 - Develop a Decision Rule**

15 The purpose of this step is to integrate the output from the previous steps of the DQO
16 process into a statement that defines the conditions that would cause the decision
17 maker to choose among alternative actions. Key activities associated with this step
18 include the following:

- 19 – Specifying the parameter of interest (i.e., mean, medium, maximum, or proportion)
- 20 – Specifying the action level for the decision

21 • **Step 6 - Specify Limits on Decision Errors**

22 The purpose of this step is to specify the acceptable decision error limits based on a
23 consideration of the consequences of making an incorrect decision. These limits will
24 be used in the last step of the process.

25 • **Step 7 - Optimize the Design**

26 The purpose of this step is to identify the most resource-effective sampling design
27 that generates data that satisfy the DQOs specified in the preceding steps. To develop
28 the optimal design for this study, it may be necessary to work through this step more
29 than once after revisiting previous steps of the DQO process. Several of the steps in

1 the DQO process can occur simultaneously; and in some situations, the process does
 2 not have to include all steps. For example, when enforcement or compliance
 3 monitoring programs are being developed to comply with existing regulations, many
 4 of the steps may have already been completed. As a general guideline, if a
 5 contaminant in a well has not been detected in 2 years (4 consecutive sampling
 6 events) it will be recommended that the contaminant will be removed from the
 7 sampling program for that well (pending NMED approval).

8 **5.2.2 Interim Measures Facility-Wide Groundwater Monitoring Data Quality Objectives**

9 The DQO process answers the questions of why this investigation is being conducted and
 10 what decisions are to be supported. In addition, the DQO process ensures that the data
 11 collected will have a quantifiable degree of certainty. In using the seven-step DQO process
 12 outlined in Section 5.2.1, the following DQOs for the sampling and analytical program for
 13 the Interim Measures Facility-Wide GMP were identified and summarized in the table below:
 14

Objective	Discussion
State the Problem	Monitor constituents exceeding cleanup levels in groundwater during the period before long-term monitoring can begin.
Identify the Decision	1. Identify changes in ambient chemical conditions that affect fate and transport. 2. Evaluate groundwater elevations to determine hydraulic gradients and groundwater flow paths. 3. Monitor temporal changes and detect the movement of COIs from one location to another.
Identify Inputs to the Decision	1. Historical background and current site information 2. Operational history 3. Geologic, hydrologic, and soil data from published sources, previous investigations, and documented field observations 4. Chemical contaminant concentration data in groundwater, including: VOCs, SVOCs, explosives, TPH-GRO and DRO, TAL metals including mercury (dissolved and total), perchlorate, nitrate/nitrite, and pesticides 5. NMWQCC standards ^a 6. EPA MCLs ^b 7. EPA RSLs for tap water ^c

Objective	Discussion
Define the Study Boundaries	<p>The boundaries of the monitoring area were selected based on review of the historical operational history and uses at the site.</p> <p>The monitoring areas are defined as follows:</p> <ul style="list-style-type: none"> - <u>Northern Area</u>: consists of the Administration and Workshop Areas in the Northern region of FWDA. Wells located in the Northern Area are further divided into Alluvial wells and Bedrock wells - <u>OB/OD Area</u>: located within the southwest and western portions of the installation; the OB/OD Area can be separated into two sub-areas based on period of operation (Closed and Current OB/OD Area).
Develop a Decision Rule	<ol style="list-style-type: none"> 1. If COIs in a given analytical suite are detected at frequencies >15% at concentrations above NMWQCC groundwater quality standards and EPA MCLs, it is recommended that the analytical suite be sampled in that particular well on a semi-annual basis. 2. If COIs in a given suite are detected at frequencies <15% at concentrations above the NMWQCC groundwater quality standards and EPA MCLs, such as SVOCs in the Northern Area, it is recommended that the analytical suite be sampled in that particular well every two years. 3. If COIs are detected at frequencies <1% at concentrations below NMWQCC groundwater quality standards and EPA MCLs, such as pesticides, it is recommended that the analytical suite be sampled in that particular well every five years
Specify Limits on Decision Errors	<ol style="list-style-type: none"> 1. If sample analytical data show false positive indicators, that is, the presence of COIs in groundwater when truly none are present, this could result in additional investigation when none is required. QC procedures followed in the field and laboratory, as well as the data from QC sample analyses, will minimize the probability of making the decision for additional investigation based on false positive data. 2. A false negative decision error, that is, failing to detect and measure COIs present in groundwater samples, could result in a determination to reduce or eliminate COI analytical suites for the site or well when further investigation is warranted. The sampling plan design and QC procedures employed minimize the probability of making a false negative decision error. The investigation is designed to detect and measure COIs in the most likely exposure pathways.

Objective	Discussion
Optimize the Design	<p>1. NMED and EPA-approved sampling methods will be used to provide definitive-level quantitative analytical data that will meet the applicable or relevant and appropriate requirements specified in the Permit (NMED, 2005).</p> <p>2. Historical data will be used to re-evaluate the constituent groups to be analyzed and the sampling frequencies at each target well for both the OB/OD and Northern Areas in accordance with Section V.A.4 of the Permit (NMED, 2005). If a constituent group has not been detected at a well for four consecutive sampling events, it will be recommended for it to be removed from the sampling program.</p>

^a EPA, 2009, National Primary Drinking Water Standards Human Health Standards, EPA 816-F-09-0004, adopted by NMWQCC.

^b EPA, 2011, U.S. Environmental Protection Agency Regions 3, 6, and 9 Regional Screening Levels for Chemical Contaminants at Superfund Sites, October. http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/index.htm.

^c EPA, 2012, U.S. Environmental Protection Agency Regional Screening Level Tapwater Supporting Table, http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/index.htm (April).

> = Greater than

< = Less than

COI = Contaminant of interest

TPH-DRO = Total petroleum hydrocarbon as diesel range organics

EPA = U.S. Environmental Protection Agency

FWDA = Fort Wingate Depot Activity

TPH-GRO = Total petroleum hydrocarbon as gasoline range organics

MCL = Maximum contaminant level

NMED = New Mexico Environment Department

NMWQCC = New Mexico Water Quality Control Commission

OB/OD = Open Burn/Open Detonation

QC = Quality control

RSL = Regional screening level

SVOC = Semivolatile organic compound

TAL = Target Analyte List

VOC = Volatile organic compound

In addition, NMED- and EPA-approved sampling methods will be used to provide definitive-level quantitative analytical data that will meet the applicable or relevant and appropriate requirements specified in the Permit. Laboratories performing the sample analyses will follow the most recent version of the USACE EM 200-1-3 (USACE, 2001) and the most recent version of Department of Defense Quality Systems Manual (Appendix F).

Laboratories performing sample analyses will hold current National Environmental Laboratory Accreditation Program (NELAP) accreditation for all appropriate fields of testing. Laboratories will also meet NMED and EPA standards, as required. Laboratories will submit self-declaration forms (including supporting documentation) as well as information related to NELAP accreditation to the USACE COR. Analytical results will be validated in Interim Facility-Wide

1 accordance with the most current versions of EPA Contract Laboratory Program (CLP)
2 National Functional Guidelines for Organic Data Review (EPA, 2008) and EPA CLP
3 National Functional Guidelines for Inorganic Data Review (EPA, 2010) to ensure the data
4 are of sufficient quality for the intended use.

5 **5.3 Interim Groundwater Monitoring Analytical Program**

6 FWDA is in an ongoing RCRA assessment and compliance monitoring phase (interim).
7 Currently, sufficient data have been collected to identify COIs based on their magnitude and
8 spatial distribution as well as their association with known waste management activities.
9 These COIs include: explosives, nitrate/nitrite, perchlorate, petroleum hydrocarbons, and a
10 limited list of VOCs and SVOCs. Compounds identified as COI require the most intensive
11 monitoring level because their spatial distribution and transport in groundwater must be
12 known to develop and evaluate appropriate corrective actions. Other detected chemicals
13 require monitoring to better understand their presence in groundwater, but the monitoring
14 program need not be as intensive. Targeting specific wells for sampling and analysis, and/or
15 modifying the sampling for these analytical suites, can optimize the program design.

16
17 Attachment 7 of the Permit (NMED, 2005) provides cleanup levels applicable to the FWDA
18 groundwater monitoring program. Groundwater chemical results are evaluated and compared
19 to these cleanup levels (referred to as regulatory health standards). Therefore, the following
20 documents and regulations are used to determine if the concentration of a particular
21 hazardous constituent exceeds the Permit cleanup level (Appendix G).

- 22
- 23 • New Mexico Water Quality Control Commission (NMWQCC) standards of
24 20.6.2.4103.A and B New Mexico Administrative Code.
 - 25
 - 26 • EPA drinking water maximum contaminant level (MCL) under Title 40 Code of
27 Federal Regulations Parts 141 and 142.
 - 28
 - 29 • If both a NMWQCC standard and an EPA MCL have been established for a
30 contaminant, the lower of the two was used as a criterion.
 - 31
 - 32 • If no NMWQCC standard or EPA MCL has been established for a particular
33 carcinogenic or noncarcinogenic hazardous constituent, the EPA regional screening
34 level for tap water was used.
 - 35

- 1 • Currently, there is no NMWQCC groundwater standard or MCL for perchlorate;
2 however, perchlorate concentrations were compared to the value of 6 µg/L noted in
3 the Permit.

4 The current monitoring well network has been designed to evaluate the horizontal and
5 vertical extent of chemical constituents in groundwater, and the transport of chemicals that
6 originate from multiple sources. Not all wells need to be sampled for the same analytical
7 suites because certain wells are located to monitor releases from specific SWMUs, and the
8 density of the well network is such that targeting select wells, rather than all wells, provides
9 sufficient data that meet the objectives of the monitoring program.

10 In accordance with Section V.A.4 of the Permit (NMED, 2005), the annual revision of this
11 Interim Measures Facility-Wide GMP re-evaluates the constituent groups to be analyzed and
12 the sampling frequencies at each target well using historical analytical data. To date,
13 sampling frequency has been semi-annual and has not been modified. However, adjusting the
14 sample frequency along with targeting select wells for specific sampling analysis are of
15 central importance to maximizing the amount of relevant information (information required
16 to effectively address the temporal and spatial objectives of monitoring program), while
17 minimizing costs. Section 5.3.1 discusses this Interim Measures Facility-Wide GMP
18 sampling rationale, including the specific chemical constituents to be analyzed and the
19 proposed sampling frequency.

20

21 ***5.3.1 Sampling Program Rationale***

22 Table 5-1 provides summary statistics for detected chemical concentrations in groundwater at
23 the OB/OD Area. In addition, Tables 5-2 and 5-3 list the summary statistics for detected
24 chemical concentrations in groundwater for the alluvial and bedrock aquifers in the Northern
25 Area, respectively. These tables do not include dissolved metals because approved
26 groundwater background levels have not been established for FWDA. Therefore, specific
27 identification of dissolved metals that may represent a COI cannot be determined at this time
28 (anthropogenic vs. naturally occurring). However, dissolved and total metals and mercury
29 (total and dissolved) will continue to be sampled semi-annually until this evaluation criterion
30 has been completed.

31

1 Chemicals detected in groundwater can be subdivided into three categories based on criteria
2 as defined in past monitoring plans. While maintaining consistency, the criteria and number
3 of categories may be reevaluated and/or optimized as the data trends and analyses become
4 more evident. In the meantime, the following categories will be used for the purpose of
5 selecting the appropriate well network, analytical suites to monitor, and the sample frequency
6 that meets the objectives of the monitoring program:
7

- 8 • Category 1: Chemicals that are frequently detected (greater than or equal to 15
9 percent) with concentrations exceeding the applicable groundwater standard (Table 5-
10 4).
- 11 • Category 2: Chemicals that are infrequently detected (less than 15 percent) with
12 concentrations exceeding the applicable groundwater standard (Table 5-5).
- 13 • Category 3: Chemicals that are infrequently detected (less than 1 percent) with
14 concentrations below the applicable groundwater standard (Table 5-6).
- 15
- 16

17 If analytical suites or specific chemical compounds were not detected for 2 consecutive years
18 in a specific well, then these analytical suites and/or compounds were considered as not
19 being of interest, now or in the future (i.e., the data will have no effect on selection of future
20 corrective actions). Consequently, these analytical suites and/or compounds were eliminated
21 from the original chemical analysis roster presented in the initial Interim Measures Facility-
22 Wide GMP (TerranearPMC, 2008). Based on this evaluation criterion only, this annual
23 revision to the GMP eliminates specific suites from the sampling program for the individual
24 wells listed in Table 5-11. This revision also upholds the previous elimination of the
25 following analytical suites for all wells in both the OB/OD and Northern Areas:
26 dioxins/furans, cyanide, herbicides, polychlorinated biphenyls (PCBs), and white
27 phosphorus.
28

29 *5.3.1.1 Category 1*

30 Table 5-4 lists the Category 1 chemicals, the analytical suite, spatial occurrence, and the
31 frequency of detection. Chemicals classified in Category 1 occur at concentrations exceeding
32 the NMWQCC groundwater standards and/or the EPA MCLs (if present) at a frequency
33 greater than or equal to 15 percent of the total samples collected. Category 1 chemicals
34 identified for the GMP are as follows: RDX, bis(2-ethylhexyl)phthalate, carbon disulfide,
35 toluene, nitrate, nitrite, total petroleum hydrocarbon (TPH) – diesel range organics (DRO),
36 and perchlorate (Table 5-4). These Category 1 chemicals are recommended to be analyzed on
37 a semi-annual basis.
38

1 All Category 1 chemicals are considered COIs that were previously released from various
2 known sources at FWDA. Continued frequent groundwater monitoring of all VOCs at the
3 OB/OD and Northern Areas may not provide useful data for future corrective action planning
4 (i.e., long-term groundwater monitoring plan); however, because bis(2-ethylhexyl)phthalate,
5 toluene, and carbon disulfide have frequency of detections greater than 15 percent and
6 detections that exceed the applicable regulatory standard, sampling these chemicals semi-
7 annually is recommended in areas that are applicable (Table 5-4).

8
9 Total petroleum hydrocarbons (DRO and GRO), which have been historically released from
10 the USTs near Building 6 (SWMU 45) in the Northern Area, will continue to be analyzed on
11 a semi-annual basis for the well network associated with SWMU 45.

12
13 Modifications to the perchlorate, nitrate/nitrite, and explosives are not proposed at this time
14 and will continue to be monitored in select wells in the OB/OD Area and both aquifers in the
15 Northern Area on a semi-annual basis.

16 17 **5.3.1.2 Category 2**

18 Table 5-5 lists the Category 2 chemicals, the analytical suite, spatial occurrence, and the
19 frequency of detection. Chemicals classified in Category 2 occur at concentrations exceeding
20 the NMWQCC groundwater standards and/or the EPA MCLs (if present) at a frequency of
21 less than 15 percent of the total samples collected. Category 2 chemicals identified for the
22 Interim Measures Facility-Wide GMP cluster into the following analytical suites: explosives,
23 SVOCs, and VOCs (Table 5-5).

24
25 Because many SVOCs (except phenol in Northern Area bedrock wells) are grouped within
26 Category 2, it is recommended that the full SVOC analytical suite be sampled every 2 years
27 in select wells within the OB/OD and Northern Areas. Based on the sporadic occurrence of
28 SVOCs, both spatially and temporally, and their relative immobility, changes in
29 concentrations over time are expected to be relatively slow. Sampling every 2 years is
30 adequate for the spatial and temporal characterization of SVOC chemicals if present in
31 groundwater.

32 33 **5.3.1.3 Category 3**

34 Table 5-6 lists the Category 3 chemicals, the analytical suite, spatial occurrence, and the
35 frequency of detection. Chemicals classified in Category 3 occur at concentrations *below* the
36 NMWQCC groundwater standards and/or the EPA MCLs (if present) at a frequency of
37 detection less than 1 percent of the total samples taken and will not require regulatory action.

1 Because these specific chemicals are below screening levels, it is suggested that this table be
2 used to reduce the number of constituents in a given suite in the future long term monitoring
3 plan (SVOCs, VOCs, and explosives). As previously stated, these chemicals have never
4 exceeded regulatory standards and are detected rarely.

5
6 Some pesticide compounds are classified as Category 3 chemicals, thus pesticides should be
7 sampled for every 5 years in select wells within the OB/OD and Northern Areas, as
8 appropriate. Sampling every 5 years is expected to adequately characterize the spatial and
9 temporal changes of pesticides if present in groundwater. Table 5-7 discusses the chemical
10 properties of some Category 3 chemicals and their respective fate and transport
11 characteristics.

12 13 **5.3.2 OB/OD Area**

14 In 2008, the Interim Measures Facility-Wide GMP proposed a broad chemical analysis roster
15 because a comprehensive data set characterizing groundwater contamination did not exist at
16 that time (i.e., identification of COIs was uncertain). In subsequent years, the chemical roster
17 has been modified because specific compounds in several of these analytical suites, such as
18 cyanide, herbicides, PCBs, white phosphorus, and dioxins/furans, had not been detected for 2
19 consecutive years.

20
21 NOTE: the OB/OD area has munitions removal activities scheduled until 2015. While these
22 munitions clearance activities are underway, DOD safety protocols prevent non-essential
23 personnel (i.e., sampling technicians) from accessing the site. The situation has been
24 presented to the NMED during an April 3, 2013 conference call and written notification via a
25 letter dated June 10, 2013. Therefore, sampling activities in the OB/OD area is under a
26 temporary moratorium until the surface clearance activities are completed. This moratorium
27 includes all groundwater sampling and measuring of groundwater elevations and is expected
28 to be in effect until 2015.

29
30 The following paragraphs in this section will be applicable once sampling is allowed in the
31 OB/OD area. After the completion of the munitions clearance, groundwater monitoring
32 activities will resume and the following parameters will be collected.

33
34 The following roster combines the recommendations from Section 5.3.1 and lists the
35 following analytical suites for select wells (Table 5-8) for the current general characterization
36 of groundwater at the OB/OD Area:

- 37
38 • Explosives (semi-annually)

- 1 • Nitrite/nitrate (semi-annually)
- 2 • Perchlorate (semi-annually)
- 3 • TAL dissolved and total metals (semi-annually)
- 4 • Dissolved and total mercury (semi-annually)
- 5 • TCL VOCs (semi-annually)
- 6 • TCL SVOCs (every 2 years)
- 7 • Pesticides (every 5 years)

8

9 Groundwater samples will be collected from select wells in and around the OB/OD unit
10 (closed and current). The targeted wells, sampling frequencies, and analytical suites are
11 shown in Table 5-8. All remaining installed wells (plus any new wells if any are installed)
12 will be sampled semi-annually for explosives, nitrate, nitrite, perchlorate, dissolved TAL
13 metals and mercury, total TAL metals and mercury, TCL VOCs, TCL SVOCs, and pesticides
14 for a minimum of four consecutive sampling events. If a parameter is not detected in a well
15 after four consecutive sampling events, it will be recommended to be removed from the
16 sampling schedule for that specific well. QA samples will be collected as summarized in
17 Table 5-9. Additionally, quarterly water level data (site access permitting) and semi-annual
18 water quality parameters (including dissolved oxygen, pH, specific conductance, turbidity,
19 oxidation reduction potential, and temperature) will be collected and recorded as described in
20 Sections 4.1 and 4.2.

21

22 **5.3.3 Northern Area**

23 In 2008, the Interim Measures Facility-Wide GMP proposed a broad chemical analysis roster
24 because a comprehensive data set characterizing groundwater contamination did not exist at
25 that time (i.e., identification of COIs was uncertain). In subsequent years, the chemical roster
26 has been modified because specific compounds, such as herbicides, had not been detected for
27 2 consecutive years or in the case of dioxins/furans statistical evaluation indicated the
28 parameter was not a COI.

29

30 This annually updated roster combines the recommendations from Section 5.3.1 and lists the
31 following analytical suites for select wells (Table 5-8) for the current general characterization
32 of groundwater at the Northern Area:

33

- 34 • Explosives (semi-annually)
- 35 • Nitrite/nitrate (semi-annually)
- 36 • Perchlorate (semi-annually)
- 37 • TAL dissolved and total metals (semi-annually)

- 1 • Dissolved and total mercury (semi-annually)
- 2 • TCL VOCs (semi-annually)
- 3 • TCL SVOCs (semi-annually for bedrock, (semi-annually or every 2 years for
- 4 alluvium)
- 5 • Pesticides (every 5 years)
- 6 • TPH-GRO and -DRO (associated with SWMU 45 only in alluvium)

7

8 Alluvial and bedrock groundwater samples will be collected from select wells in the
9 Northern Area. The targeted wells, sampling frequencies, and analytical suites are shown in
10 Table 5-8. QA samples will be collected as summarized in Table 5-10. All recently installed
11 wells will be sampled semi-annually for explosives, nitrate, nitrite, perchlorate, dissolved
12 TAL metals and mercury, total TAL metals and mercury, TCL VOCs, TCL SVOCs,
13 pesticides, and TPH-GRO and TPH-DRO (wells associated with SWMU 45) for a minimum
14 of four consecutive sampling events. If a parameter is not detected in a well after four
15 consecutive sampling events, it will be recommended to be removed from the sampling
16 schedule for that specific well. Additionally, quarterly water level data (site access
17 permitting) and semi-annual water quality parameters (including dissolved oxygen, pH,
18 specific conductance, turbidity, oxidation reduction potential, and temperature) will be
19 collected and recorded as described in Sections 4.2 and 4.3.

20

21 NOTE: The monitoring wells associated with the East Landfill in Parcel 18 (EMW01,
22 EMW02, EMW03, and EMW04) are scheduled to be plugged and abandoned once the
23 landfill is removed; scheduled for sometime in 2013-2014 and subject to NMED approval. If
24 the East Landfill monitoring wells are not plugged and abandoned as schedule, they will
25 continue to be sampled and the groundwater elevations measured. If (or when) the wells are
26 abandoned, they will be removed from the sampling program.

27

28 **5.4 Data Validation**

29 An independent data validation of the results of all chemical analyses analyzed by the
30 accredited laboratory will be performed using the most recent version of the USACE EM
31 200-1-3 (USACE, 2001) and the *Department of Defense Quality Systems Manual for*
32 *Environmental Laboratories* (U.S. Department of Defense, 2010) (Appendix F). Laboratories
33 performing sample analyses will hold current NELAP accreditation for all appropriate fields
34 of testing. Laboratories will also meet NMED and EPA standards, as required. Laboratories
35 will submit self-declaration forms along with information related to NELAP accreditation to
36 the USACE COR.

37

1 Analytical results will be validated in accordance with the most current versions of EPA CLP
2 National Functional Guidelines for Organic Data Review (EPA, 2008) and EPA CLP
3 National Functional Guideline for Inorganic Data Review (EPA, 2010) to ensure the data are
4 of sufficient quality for the intended use. Data validation will consist of the following:
5

- 6 • Verification that the amount of data requested matches the amount of data received
7 (i.e., completeness check)
8
- 9 • Verification of the procedures/methods used
10
- 11 • Verification that documentation/deliverables are complete
12
- 13 • Verification that hard copy and electronic versions of the data are identical
14
- 15 • Verification that the data seem reasonable based on analytical methodologies
16
- 17 • Evaluation and qualification of results based on sample receipt (sample temperature
18 and preservation) and holding-time compliance
19
- 20 • Qualification of results based on method, field, and rinse blank results
21
- 22 • Evaluation and qualification of results based on MS/MSD analyses
23
- 24 • Evaluation and qualification of results based on surrogate recoveries
25
- 26 • Evaluation and qualification of results based on internal standard performance
27
- 28 • Verification that the analytical instrument was calibrated in accordance with required
29 instrument and method criteria
30
- 31 • Evaluation and qualification of results based on initial and continuing instrument
32 calibration verification check sample analyses, and initial and continuing instrument
33 calibration blank results
34
- 35 • Evaluation and qualification of results based on laboratory control sample analyses
36
- 37 • Evaluation and qualification of results based on laboratory and field duplicate
38 precision
39

- 1 • Verification that the instrument was properly tuned before sample analyses
- 2
- 3 • Verification that the analytical sequence included pertinent information required to
- 4 track the analyses of all QA/QC and environmental samples
- 5

6 For new data, the USACE has specified a 100 percent Level 2a, Functional Guideline
7 equivalent validation procedures, and a 10 percent Level 4 validation on all sample data
8 generated for FWDA.

9

10 Standard EPA data qualifiers shall be used to indicate: (1) blank contamination, (2) sample-
11 analytical anomalies associated with a constituent, (3) analytical results that fall between the
12 MDL and the limit of quantitation, (4) data qualified because of an exceedance of method-
13 specific holding times, high cooler temperatures, or other significant QA/QC data
14 deficiencies, and (5) data results that exceed the upper calibration curve limit for that
15 constituent and associated analytical instrument.

16

17 A Data Quality Summary Report, that will include a Data Validation Report, will be prepared
18 that will discuss the performance of the laboratory with respect to the factors presented
19 above. As much as possible, data will be presented in tabular form. In addition, the Data
20 Validation Report will discuss the following:

- 21
- 22 • Actual MDLs and/or the limits of quantitation, as applicable;
- 23
- 24 • Adequacy of the detection limit for the intended purpose
- 25
- 26 • The possible influence(s) of matrix interferences, dilution factors, unusual shipping
- 27 conditions, and any variance from the reference analytical methods
- 28
- 29 • Usability of the data with respect to the project objectives
- 30
- 31 • Attainment of DQO process-derived decision statements with respect to chemical
- 32 data quality
- 33

34 An electronic data deliverable will be provided in a Microsoft® Access format compatible
35 with USACE Albuquerque and FWDA Environmental Data Management System (EDMS)
36 standards.

37

38 **5.5 *Environmental Data Management***

1 Following review and approval, the data will be loaded into the FWDA EDMS database. As
2 noted in Section 5.1.2, the groundwater sampling Statement of Work will contain the
3 required information to ensure that data reporting and electronic data deliverables are
4 compatible with the FWDA EDMS.

5 6 **5.6 Data Evaluation**

7 As described in Section 5.3, groundwater data generated during ground water monitoring will
8 be evaluated with respect to cleanup levels described in Attachment 7 of the Permit (NMED,
9 2005).

10 11 **5.7 Reporting**

12 Analytical results will be submitted in a semi-annual report prepared in accordance with
13 NMED guidance entitled *General Reporting Requirements for Routine Groundwater*
14 *Monitoring at RCRA Sites* (2003; included in Appendix G). The report will be submitted to
15 NMED not more than 60 days subsequent to the receipt of final validated laboratory reports.

1 **6. SCHEDULE**

2 Groundwater elevation data will be collected on a quarterly basis in January, April, July, and
3 October.

4

5 Groundwater samples from in and around the OB/OD Area and in the Northern Area of
6 FWDA will be collected semi-annually in April and October.

7

8 The first sample collection under this Interim Measures Facility-Wide GMP took place in
9 April 2008 and has continued each April and October according to the existing GMP.

**Table 4-1 (concluded)
Groundwater Purge Method**

Well ID	Casing Diameter (in)	Well Depth (ft bgs)	Screened Interval (ft bgs)	Screen Length (in)	Dedicated Pump?	Low Flow?	Purge Method
Northern Area (concluded)							
TMW48	2.50	91.5	71.0-91.0	20.0	Yes	Yes	Trad. Low Flow
TMW49	2.50	60.0	40.0-60.0	20.0	Yes	Yes	Trad. Low Flow

ft bgs = Feet below ground surface

ID = Identification

in = Inches

ND = No data

OB/OD = Open burn/open detonation

Trad. = Traditional

ZIST = Zone Isolation System Technology

**Table 4-2
Field Equipment List**

Equipment and Materials	Elevation Survey	Traditional Low-Flow	ZIST Low-Flow	Hand Bail	Grundfos Pump	Bennett Sample Pump
Electronic water level meter, capable of measuring to 0.01 feet accuracy	X	X	X	X	X	X
Power source (generator, portable rechargeable battery, etc.)*		X	X		X	
Nitrogen Tanks		X	X			X
Reusable pump (e.g. Grundfos)					X	
Power Inverter		X	X			
Control Box		X	X		X	
Indicator field parameter monitoring instruments		X	X	X	X	X
Flow measurement supplies (e.g., graduated cylinder and stopwatch)		X	X	X	X	X
Teflon tubing		X	X		X	X
Nitrogen Tank Airline Hose		X	X			X
Teflon or polyethylene bailers				X		
Teflon clamp or connector		X	X	X	X	X
Nylon cord				X		
5-Gallon buckets		X	X	X	X	X
Large capacity Tank(s)						X
Decontamination supplies including non-phosphate detergent, distilled water, brushes, and buckets	X	X	X	X	X	X
Plastic sheeting or absorbent pads	X	X	X	X	X	X
Disposable latex or nitrile gloves	X	X	X	X	X	X
Safety glasses	X	X	X	X	X	X
Trash bags	X	X	X	X	X	X
Sample bottles		X	X	X	X	X
Sample labels		X	X	X	X	X
Shipping supplies including heavy duty cooler(s), zip-lock bags, packing tape, bubble pack, shipping forms		X	X	X	X	X
Logbook and groundwater sampling forms	X	X	X	X	X	X
Well construction data, location map, field data from last sampling event	X	X	X	X	X	X
Well keys	X	X	X	X	X	X

*If a gasoline generator is used, it will be located downwind and at least 15 feet from the well so that the exhaust fumes do not contaminate the samples

ZIST = Zone Isolation Sampling Technology

Note: If both a NMWQCC standard and an EPA MCL have been established for a contaminant, the more conservative value will be compared against. If no NMWQCC standard or EPA MCL have been established, the EPA HHMSSL will be compared against.

^a Table summarizes groundwater data collected at FWDA from April 2008 through October 2012.

^b New Mexico Water Quality Control Commission (NMWQCC), 2001. 20.6.2.7(w) New Mexico Administrative Code (NMAC), Definitions – toxic pollutant.

^c U.S. Environmental Protection Agency (EPA), 2012. Regions 3, 6, and 9 Regional Screening Levels for Chemical Contaminants at Superfund Sites, updated November.

^d U.S. Environmental Protection Agency (EPA), 2012. Regional Screening Level Tapwater Supporting Table, updated November.

^e For perchlorate, a value of 6 µg/L is used per the FWDA RCRA Permit

> = Greater than

EPA = Environmental Protection Agency

FWDA = Fort Wingate Depot Activity

HHMSSL = Human Health Medium-Specific Screening Level

MCL = Maximum Contaminant Level

µg/L = Microgram per liter

NE = Not established

NMED = New Mexico Environment Department

NMWQCC = New Mexico Water Quality Control Commission

No. = Number

OB/OD = Open Burn/Open Detonation

RCRA = Resource Conservation and Recovery Act

* Wells have been recently installed (2011 – 2012)

^a *Test Methods for Evaluating Solid Waste*, Second Edition, Office of Solid Waste Manual SW-846

Note: Semi-annual sample collection under the Interim Groundwater Monitoring Plan began in April 2008 and has continued each April and October

Indicates that the specific well has never had a detection for any analyte in the applicable analytical suite

EPA = Environmental Protection Agency

2x = Semi-annually

x/2 = Every two years

x/5 = Every five years

FWDA = Fort Wingate Depot Activity

GW = Groundwater

ID = Identification

OB/OD = Open Burn/Open Detonation

Quarterly = Samples/water levels collected in January, April, July, and October

Semi-annually = Samples collected in April and October

SVOC = Semi-volatile Organic Compound

TAL = Target Analyte List

TCL = Target Compound List

TPH-DRO = Total Petroleum Hydrocarbon - Diesel Range Organics

TPH-GRO = Total Petroleum Hydrocarbon - Gasoline Range Organics

VOC = Volatile Organic Compound

**Table 5-9
Analytical Requirements and Sample Summary for OB/OD Area Wells
REMOVED FROM SAMPLING PLAN UNTIL 2015 DUE TO SURFACE CLEARANCE CONDUCTED BY URS**

Matrix	Analytical Group	Analytical Method ^a	Container (Number, Size, and Type)	Preservation Requirements	Analytical Holding Time	Number of Samples	Number of Field Duplicates ^b	Number of Field Triplicate (Split) Samples ^b	Number of MS/MSD Samples ^c	Number of Field Blank Samples
Water	TCL VOCs	8260C	(3) - 40 mL VOC glass vials	Cool to ≤4°C; pH <2 with HCl	14 days to analysis	16	2	2	1	TBD
Water	TCL SVOCs	8270D	(1) - 1 L Amber bottle	Cool to ≤4°C	7 days extraction/40 days analysis	6	1	1	1	TBD
Water	Explosives	8330B	(2) - 1 L Amber bottles	Cool to ≤4°C	7 days to extraction; 40 days from extraction to analysis	9	1	1	1	TBD
Water	Nitrite	9056	(1) - 500 mL Poly bottle	Cool to ≤4°C	28 days to analysis	13	2	2	1	TBD
Water	Perchlorate	6860	(1) - 250 mL Poly bottle	Cool to ≤4°C	28 days	9	1	1	1	TBD
Water	Pesticides	8081A	(1) - 1 L Amber bottle	Cool to ≤4°C	7 days to extraction; 40 days from extraction to analysis	3	1	1	1	TBD
Water	Nitrate	9056	(1) - 250 mL Poly bottle	Cool to ≤4°C; H2SO4 to pH <2	48 hours to analysis	13	2	2	1	TBD
Water	Total Mercury/TAL Metals	7470/6010C or 6020B	(1) - 1 L Poly bottle	Cool to ≤4°C; HNO3 to pH <2	6 months for TAL metals; 28 days for Mercury	16	2	2	1	TBD
Water	Dissolved Mercury/TAL Metals	7470/6010C or 6020B	(1) - 1 L Poly bottle	Cool to ≤4°C; HNO3 to pH <2	6 months for TAL metals; 28 days for Mercury	16	2	2	1	TBD
Total Number of Samples						101	14	14	9	TBD

^a Test Methods for Evaluating Solid Waste, Second Edition, Office of Solid Waste Manual SW-846

^b One per ten samples

^c One per twenty samples

^d One per cooler with volatile samples

Note: Number of samples is based on proposed sample frequency

< = Less than

°C = Degree Celsius

H₂SO₄ = Sulfuric acid

HCl = Hydrochloric acid

HNO₃ = Nitric acid

L = Liter

mL = Milliliter

SVOC = Semi-volatile organic compound

TAL = Target Analyte List

TBD = To be decided based per sampling event

TCL = Target Compound List

VOC = Volatile organic compound
