Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

2) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of Detection

LOQ = Limit of Quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Endocrine	0.13
All Others	0.26

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Cumulative Risk/Hazard		**6E-07**	**0.07**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Endocrine	0.16
All Others	0.32

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

Cyanide	57-12-5	mg/kg	0.32	U			NS	NS	11.2	N	NMED		
Nitrate	14797-55-8	mg/kg	4.7	J			NS	NS	125,000	N	NMED		3.76E-05
Perchlorate	14797-73-0	mg/kg	0.002	UJ			NS	NS	54.8	N	NMED		
										Cumulative Risk/Hazard		**3E-06**	**0.8**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of qauntitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)
N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.
According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.
CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

All Others	0.38

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Cumulative Risk/Hazard		**5E-07**	**0.06**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Exceeds Target Level		**N**	Y	

System	Hazard Quotient
Nervous	0.98
Endocrine	0.13
All Others	0.30

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of qauntitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

All Others	0.34

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

Perchlorate	14797-73-0	mg/kg	0.002	UJ			NS	NS	908	N	NMED		
										Cumulative Risk/Hazard		**7E-07**	**0.07**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den Berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update)

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

System	Hazard Quotient
Nervous	0.4
Endocrine	0.27
GI	0.24
All Others	0.28

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**7E-07**	**0.07**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Cumulative Risk/Hazard		**5E-07**	**1.8**	
										Exceeds Target Level		**N**	**Y**	

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

System	Hazard Quotient
Nervous	1.3
Endocrine	0.17
GI	0.13
Blood	0.13
All Others	0.21

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

Cyanide	57-12-5	mg/kg	0.31	U			NS	NS	11.2	N	NMED			
Nitrate	14797-55-8	mg/kg	1.8	J			NS	NS	125,000	N	NMED		1.44E-05	
Perchlorate	14797-73-0	mg/kg	0.002	UJ			NS	NS	54.8	N	NMED			
										Cumulative Risk/Hazard		**3E-06**	**1.0**	
										Exceeds Target Level		**N**	**Y**	

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

System	Hazard Quotient
Nervous	0.3
Endocrine	0.24
GI	0.20
All Others	0.29

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection Limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Cumulative Risk/Hazard		**6E-07**	**0.06**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den Berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update)

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**6E-07**	**0.06**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Endocrine	0.15
GI	0.10
Blood	0.10
All Others	0.19

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**Y**	

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

System	Hazard Quotient
Nervous	0.3
Endocrine	0.34
GI	0.22
Heart	0.12
All Others	0.18

Nitrate	14797-55-8	mg/kg	7.9	J			NS	NS	2,080,000	N	NMED		3.80E-06
Perchlorate	14797-73-0	mg/kg	0.0018	UJ			NS	NS	908	N	NMED		
										Cumulative Risk/Hazard		**7E-07**	**0.06**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den Berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update)

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Cumulative Risk/Hazard		**5E-07**	**1.5**	
										Exceeds Target Level		**N**	**Y**	

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

System	Hazard Quotient
Nervous	1.1
Endocrine	0.14
GI	0.10
Blood	0.10
All Others	0.20

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**1E-09**	**0.06**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

Blood	0.11
All Others	0.19

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

2) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

3) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

4) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

5) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

TABLE D1-AO25-1
HUMAN HEALTH RISK SCREEN AND CALCULATION OF RESIDENTIAL RISKS FOR HIGH DENSITY BUFFER AREA GRID AO25
FORT WINGATE DEPOT ACTIVITY INNER FENCE
MCKINLEY COUNTY, NEW MEXICO

	CAS Number	Units	Final Result		Raw Data Result	TEF	Residential Value Cancer Endpoint	Exceeds Residential SSL (cancer) (Y/N)	Residential Value Noncancer Endpoint	Exceeds Residential SSL (noncancer) (Y/N)	Source (1)	Estimated Cancer Risk	Estimated Hazard Quotient
OTHER PARAMETERS (mg/kg)													
Cyanide	57-12-5	mg/kg	0.32	U			NS	NS	11.2	N	NMED		
Nitrate	14797-55-8	mg/kg	4.3	J			NS	NS	125,000	N	NMED		3.44E-05
Perchlorate	14797-73-0	mg/kg	0.0018	UJ			NS	NS	54.8	N	NMED		
										Cumulative Risk/Hazard		**3E-06**	**0.93**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

ηg/kg = nanograms per kilogram
CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**2E-07**	**0.95**
										Exceeds Target Level		**N**	**N**

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

ηg/kg = nanograms per kilogram

CAS = Chemical Abstracts Service

IEUBK = Integrated Exposure Uptake Biokentic Model

J = Estimated

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

All Others	0.31

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

Cyanide	57-12-5	mg/kg	0.33	U			NS	NS	63	N	NMED		
Nitrate	14797-55-8	mg/kg	8.9	J			NS	NS	2,080,000	N	NMED		4.28E-06
Perchlorate	14797-73-0	mg/kg	0.002	UJ			NS	NS	908	N	NMED		
										Cumulative Risk/Hazard		**7E-07**	**0.06**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

System	Hazard Quotient
Nervous	1.3
Endocrine	0.12
All Others	0.32

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

System	Hazard Quotient
Nervous	0.4
Endocrine	0.40
GI	0.27
Heart	0.16
Hair/Coat	0.15
Eyes	0.15
All Others	0.18

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

System	Hazard Quotient
Nervous	0.31
Endocrine	0.38
GI	0.24
Heart	0.16
Hair/Coat	0.13
Eyes	0.13
All Others	0.17

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**9E-07**	**0.08**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

Blood	0.11
All Others	0.28

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023,

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients mat be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**6E-07**	**0.06**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den Berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update)

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Endocrine	0.12
All Others	0.32

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**7E-07**	**0.07**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Blood	0.11
All Others	0.24

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Endocrine	0.11
All Others	0.30

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**6E-07**	**0.06**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den Berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update)

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

System	Hazard Quotient
Nervous	1.1
Endocrine	0.11
All Others	0.31

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**6E-07**	**0.05**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Endocrine	0.10
All Others	0.29

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**5E-07**	**0.07**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Cyanide	57-12-5	mg/kg	0.34	U			NS	NS	11.2	N	NMED		
Nitrate	14797-55-8	mg/kg	11				NS	NS	125,000	N	NMED		8.80E-05
Perchlorate	14797-73-0	mg/kg	0.0043	U			NS	NS	54.8	N	NMED		
										Cumulative Risk/Hazard		**3E-06**	**0.8**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**9E-07**	**0.05**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

DL = Detection limit

J = Estimated

LOD = Limit of detection

LOQ = Limit of quantitation

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect

UTL = Upper tolerance limit

										Cumulative Risk/Hazard		**2E-06**	**0.7**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**5E-07**	**0.04**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

System	Hazard Quotient
Nervous	0.87
Endocrine	0.10
All Others	0.24

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Cumulative Risk/Hazard		**2E-06**	**0.7**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**5E-07**	**0.05**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**5E-07**	**0.05**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Endocrine	0.11
All Others	0.24

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Perchlorate	14797-73-0	mg/kg	0.0044	U			NS	NS	54.8	N	NMED		
										Cumulative Risk/Hazard		**3E-06**	**0.8**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**5E-07**	**0.05**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be disucssed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**5E-07**	**0.05**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

										Cumulative Risk/Hazard		**3E-07**	**1.3**	
										Exceeds Target Level		**N**	Y	

System	Hazard Quotient
Nervous	0.96
Endocrine	0.11
All Others	0.25

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

Nitrate	14797-55-8	mg/kg	2	U			NS	NS	2,080,000	N	NMED		
Perchlorate	14797-73-0	mg/kg	0.0041	U			NS	NS	908	N	NMED		
										Cumulative Risk/Hazard		**6E-07**	**0.05**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

OTHER PARAMETERS (mg/kg)														
Cyanide	57-12-5	mg/kg	0.32	U			NS	NS	12	N	NMED			
Nitrate	14797-55-8	mg/kg	2	U			NS	NS	566,000	N	NMED			
Perchlorate	14797-73-0	mg/kg	0.0041	U			NS	NS	248	N	NMED			
										Cumulative Risk/Hazard		**3E-07**	**1.3**	
										Exceeds Target Level		**N**	**Y**	

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

System	Hazard Quotient
Nervous	0.93
Endocrine	0.11
All Others	0.25

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

Cyanide	57-12-5	mg/kg	0.32	U			NS	NS	63	N	NMED		
Nitrate	14797-55-8	mg/kg	5.3	J			NS	NS	2,080,000	N	NMED		2.55E-06
Perchlorate	14797-73-0	mg/kg	0.0042	U			NS	NS	908	N	NMED		
										Cumulative Risk/Hazard		**6E-07**	**0.06**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

System	Hazard Quotient
Nervous	1.4
Endocrine	0.11
All Others	0.32

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**7E-07**	**0.07**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be disucssed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
J = Estimated
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect

										Exceeds Target Level		**N**	**Y**	

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

System	Hazard Quotient
Nervous	0.26
Endocrine	0.32
GI	0.20
Heart	0.12
Hair/Coat	0.12
Eyes	0.12
All Others	0.15

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of Quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper Tolerance Limit

										Cumulative Risk/Hazard		**7E-07**	**0.07**
										Exceeds Target Level		**N**	**N**

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

System	Hazard Quotient
Nervous	1.6
Endocrine	0.13
All Others	0.31

Notes:

[s] = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update).

2) NMED[C] = For chemicals with no current NMED SSL, the SSL was calculated using NMED methodology. See **Appendix D**.

3) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

4) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service
DL = Detection limit
J = Estimated
LOD = Limit of detection
LOQ = Limit of quantitation
mg/kg = milligrams per kilogram
NS = No Standard
U = Nondetect
UJ = Estimated Nondetect
UTL = Upper tolerance limit

Notes:

s = 1,3-Dichloropropene was used as a surrogate for 1,1-dichloropropene and cis- and trans-1,3-dichloropropene. 1,4-Dichlorobenzene was used as a surrogate for 1,3-dichlorobenzene. 1,2-Dichloropropane was used as a surrogate for 2,2-dichloropropane. For m,p-xylenes the lower value between m-xylene and p-xylene was used for the sum of the isomers. Cumene was used as a surrogate for p-isopropyltoluene. 4-Nitroaniline was used as a surrogate for 3-nitroaniline. Pyrene was used as a surrogate for acenaphthylene and benzo(g,h,i)perylene.

1) NMED = New Mexico Environment Department Screening Levels (NMED 2022, November update). Cancer Risk = 1E-05, Hazard Quotient 1; RSL = Regional Screening Levels (USEPA 2023, November Update). Cancer Risk Adjusted to = 1E-05, Hazard Quotient = 1

2) Toxicity data for the dioxin and furan congeners were assessed using the 2005 World Health Organization's (WHO) toxicity equivalency factors (TEF) (Van den berg, et al 2006). TEFs were applied to the analytical results and summed for each sample resulting in a toxicity equivalent (TEQ). The TEQ was then compared to the NMED cancer and non-cancer SSLs for 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD). (NMED 2022, November update).

3) Chromium screening value is for Total Chromium.

Dibenz(a,h)anthracene has an SSL above the DL and LOD but below the LOQ. However, this compound is not known to have been used at FWDA. Dibenzo(a,h)anthracene is a polycyclic aromatic hydrocarbon (PAH) with no commercial production or known use. It occurs as a component of coal tars, shale oils, and soots and has been detected in gasoline engine exhaust, coke oven emissions, cigarette smoke, charcoal broiled meats, vegetation near heavily travelled roads, and combustion sources. (If there was a detection between the DL and LOQ the lab would J qualify the result the substance might be there but at a higher degree of uncertainty. Results were U qualified to the LOD as non-detect per the DoD QSM.)

N-Nitrosodimethylamine has an SSL below the DL, LOD, and LOQ. However, this analyte is not suspected to have been used at Fort Wingate. N-nitrosodimethylamine was produced by industry only in small amounts for research.

According to Section 5.3 of the NMED RAG, November 2022 update, essential nutrients (calcium, chloride, magnesium, phosphorus, potassium, sodium) should be evaluated separately. "If the maximum detected concentration for the site is below the soil SSL, resulting in an HQ of less than one, then exposure is not likely to cause adverse effects to receptors, and the inorganic constituent may be eliminated from further evaluation in the risk assessments. The risks from essential nutrients may be discussed separately from the overall HI for noncarcinogens.

CAS = Chemical Abstracts Service

J = Estimated

mg/kg = milligrams per kilogram

NS = No Standard

U = Nondetect

UJ = Estimated Nondetect
