*Form Approved
OMB No. 0704-0188*

The public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

1 EXECUTIVE SUMMARY

2 This Interim Measures Facility-Wide Groundwater Monitoring Plan (GMP) for Fort Wingate
3 Depot Activity (FWDA) describes the proposed groundwater monitoring to be conducted as
4 part of the Environmental Restoration Program at FWDA. This document has been prepared
5 for submission to the New Mexico Environment Department-Hazardous Waste Bureau
6 (NMED-HWB), as required by Section V.A of Resource Conservation and Recovery Act
7 Permit No. NM 6213820974, December 2005-revised April 2014 (herein referred to as the
8 Permit).

9

10 The current monitoring well network has been designed to evaluate the horizontal and
11 vertical extent of chemical constituents in groundwater, and the transport of chemicals that
12 originate from multiple sources. Not all wells need to be sampled for the same analytical
13 suites because certain wells are located to monitor releases from specific Solid Waste
14 Management Units (SWMUs) and Areas of Concern (AOCs). The density of the well
15 network is designed such that targeting select wells for specific chemical analyses, rather
16 than all wells, provides sufficient data that meet the objectives of the monitoring program.

17

18 This GMP combines the original 2008 plan (approved) and subsequent revisions (annual),
19 which are revised based on an analysis of historic groundwater monitoring data and a data
20 quality objective (DQO) assessment. In accordance with Section V.A.4 of the Permit, the
21 annual revision of this Interim Measures Facility-Wide GMP re-evaluates the constituent
22 groups to be analyzed and the sampling frequencies at each target well using historical
23 analytical data.

24

25 To date, sampling frequency has been semi-annual. ~~The Army recommends sampling~~
26 ~~Northern Area wells annually due to the large number of wells in this area that have been~~
27 ~~nondetect for multiple analytes over four consecutive sample events. Additionally, the low~~
28 ~~hydraulic conductivity in this area will serve to retard contaminant migration. Adjusting the~~
29 ~~sample frequency along with targeting select wells for specific sampling analysis are of~~
30 ~~central importance to maximizing the amount of relevant information (information required~~
31 ~~to effectively address the temporal and spatial objectives of monitoring program), while~~
32 ~~minimizing costs.~~ Section 5.3.1 discusses this Interim Measures Facility-Wide GMP
33 sampling rationale, including the specific chemical constituents to be analyzed and the
34 proposed sampling frequency.

35

1 ***ES.1 PURPOSE***

2 The purpose of this Interim Measures Facility-Wide GMP is to describe the groundwater
3 monitoring program for the interim period before long-term monitoring can begin.
4

5 ***ES.2 PROPOSED INVESTIGATIONS***

6 As described in this revision of the Interim Measures Facility-Wide GMP, the groundwater
7 monitoring program will consist of the following data collection.
8

9 ***ES.2.1 Groundwater Elevation Surveys***

10 Groundwater elevation data will be collected from all existing wells. As directed by the
11 NMED-HWB, groundwater elevation data will be collected on a quarterly basis in January,
12 April, July, and October.
13

14 ***ES.2.2 Groundwater Sampling***

15 ***ES.2.2.1 Initial Groundwater Monitoring Program – 2008***

16 The 2008 GMP initially identified semi-annual (April and October) sampling for the
17 following analytical suites for characterization of groundwater at the Open Burning/Open
18 Detonation (OB/OD) Unit and Parcel 3 SWMUs (OB/OD Area), and the Northern FWDA
19 SWMUs and AOCs (Northern Area).
20

21 **OB/OD Area**

- 22
- 23 • Explosives
 - 24 • Nitrate/nitrite
 - 25 • Perchlorate
 - 26 • Target analyte list (TAL) metals (total and dissolved)
 - 27 • White phosphorus
 - 28 • Target compound list (TCL) volatile organic compounds (VOCs)
 - 29 • TCL semivolatile organic compound (SVOC)
 - 30 • Dioxins and furans
 - 31 • Cyanide
 - 32 • Polychlorinated biphenyls
 - 33 • Pesticides/herbicides
- 34

1 **Northern Area**

- 2
- 3 • Explosives
 - 4 • Nitrate/nitrite
 - 5 • Perchlorate
 - 6 • TAL metals (total and dissolved)
 - 7 • TCL VOCs
 - 8 • TCL SVOCs
 - 9 • Dioxins and furans
 - 10 • Pesticides - wells in and around the Administration Area only
 - 11 • Diesel range organics - wells monitoring releases from SWMU 45 only
 - 12 • Gasoline range organics - wells monitoring releases from SWMU 45 only
- 13

14 ***ES.2.2.2 Revisions to Groundwater Monitoring Program – Versions 2-7***

15 The 2010 revision to the GMP eliminated cyanide, herbicides, polychlorinated biphenyls, and
 16 white phosphorus from the FWDA sampling roster. Based on the absence of detections, it
 17 was determined that continued monitoring for these constituents did not provide necessary
 18 and useful information. Additionally, a statistical analysis of dioxin/furan detections was
 19 submitted to the NMED with the intention of eliminating these compounds from the FWDA
 20 sampling program. In August 2011, NMED agreed that dioxins and furans can be eliminated
 21 from the sampling requirements (NMED, 2011). The 2012 revision proposed the following
 22 analytical suites and sampling frequencies for the project contaminants of interest (COIs).

23

| Analyte Group | OB/OD Unit* | Northern Area Alluvium* | Northern Area Bedrock* |
|--|-------------|-------------------------|------------------------|
| Explosives | 2x | 2x | 2x |
| Nitrate/Nitrite | 2x | 2x | 2x |
| Perchlorate | 2x | 2x | 2x |
| TAL Metals (total and dissolved) | 2x | 2x | 2x |
| Mercury (total and dissolved) | 2x | 2x | 2x |
| TCL VOCs | 2x | 2x | 2x |
| TCL SVOCs | x/2 | x/2 | 2x |
| Pesticides | x/5 | x/5 | x/5 |
| Diesel Range Organics/ Gasoline Range Organics | N/A | 2x | N/A |

24 * Select wells only (see Section 5, Table 5-8)
 25 2x = Analyses to be performed semi-annually

- 1 x/2 = Analyses to be performed every 2 years
- 2 x/5 = Analyses to be performed every 5 years
- 3 N/A = not applicable
- 4 OB/OD = Open burn/open detonation
- 5 SVOC = Semivolatile organic compound
- 6 TAL = Target analyte list
- 7 TCL = Target compound list
- 8 VOC = Volatile organic compound

9 For Version 7 of the GMP, sampling activities in the OB/OD Area were put under a
10 temporary moratorium until munitions removal activities were complete. Notification of
11 these activities was submitted in a letter dated June 10, 2013, from Mr. Mark Patterson,
12 BRAC Environmental Coordinator, to Mr. John Kieling, Hazardous Waste Bureau Chief at
13 the NMED. The revision also made provisions for the East Landfill monitoring wells being
14 plugged and abandoned if the landfill was closed/removed. Lastly, the revision updated the
15 analytical perchlorate method from U.S. Environmental Protection Agency (EPA) Method
16 6850 to EPA Method 6860 based upon the recommendation of the laboratory and project
17 chemist due to the method being capable of analyzing more perchlorate ions than 6850.

18 ***ES.2.2.3 Revised Groundwater Monitoring Program – 2015***

19 There are some changes to the sampling program for the 2015 revision (Version 8). First,
20 sampling activities for the OB/OD Area may resume if the munitions removal activities are
21 completed. The munitions removal activities have encountered schedule delays and the date
22 of completion is unknown but conceivably could be complete within the 2015/2016 sampling
23 schedule. Therefore, OB/OD sampling activities will resume at an unknown date once
24 clearance has been granted for the area. Secondly, four wells are scheduled for abandonment
25 in 2015 as approved by the NMED in a letter dated April 18, 2014. These wells are: Wingate
26 89, Wingate 90, Wingate 91, and FW26. They will be removed from the sampling program.
27 Lastly, the Army proposes an annual sampling frequency for wells located in the Northern
28 Area.

29 Finally, groundwater monitoring data were also reviewed for Version 8. ~~Any analytical suites~~
30 ~~that have not been detected for four consecutive sampling events for a monitoring well are~~
31 ~~recommended to be removed (for that specific parameter) from the sampling program in~~
32 ~~accordance to the DQO process and sampling program rationale.~~ Analytes that have not been
33 detected for four consecutive sampling events for a monitoring well are recommended to be
34 removed from the sampling program in accordance to the DQO process and sampling
35 program rationale if the following conditions apply:

- 36
- 37 a) the specific contaminant is not considered a constituent of potential concern
- 38 (COPC) at the facility and
- 39
- 40 b) has never been detected in a monitoring well.
- 41

- 1 Army will continue with monitoring as approved in the original Periodic Monitoring Work
- 2 Plan. Approval from the state will be obtained before implementing these recommendations.

1. INTRODUCTION

This Interim Measures Facility-Wide Groundwater Monitoring Plan (GMP) provides guidance for the groundwater monitoring activities to be conducted during calendar year (CY) 2015 at Fort Wingate Depot Activity (FWDA or Facility) in McKinley County, New Mexico. If no changes to the GMP are necessary then this guidance will also cover CY 2016. Innovar Environmental, Inc. (herein referred to as Innovar) and CB&I have prepared this GMP for the U.S. Army Corps of Engineers (USACE), Albuquerque District, in accordance with the Statement of Work dated March 2012 (Appendix A) under Contract No. W912PP-11-D-0024, Task Order No. 0007.

This is Version 8 of the Interim Measures Facility-Wide GMP, prepared in accordance with the Resource Conservation and Recovery Act (RCRA) Permit No. NM 6213820974 (the Permit) that became effective on 31 December 2005 and revised April 2014. Version 8 revises the previous GMP, Version 7 submitted January 2014, to reflect the current site conditions: potentially resuming sampling activities at the Open Burn/Open Detonation (OB/OD) Area and removing Wingate 89, Wingate 90, Wingate 91, and FW26 from the sampling program due to well abandonment (approved by the New Mexico Environment Department [NMED] in a letter dated April 18, 2014). ~~Additionally, the Army requests that the Northern Area wells be sampled annually, with groundwater elevation measured twice a year.~~ Revisions also include analyses of recent sampling data and historic groundwater monitoring data, assessment of data quality objectives (DQOs), and previous groundwater investigations.

1.1 Background Information

The Secretary of the NMED issued Permit No. NM 6213820974 to the United States, Department of the Army, which is the owner and operator of the FWDA. Section V of the Permit (NMED, 2005/2014) requires an NMED-approved plan to provide guidance for interim groundwater monitoring activities for the entire Facility prior to implementation of a long-term monitoring plan. Section VIII.B.1 of the Permit (NMED, 2005/2014) requires consultation with the Navajo Nation and the Pueblo of Zuni during preparation of the Interim Measures Facility-Wide GMP and the required annual updates. Responses to comments for this version of the Interim Measures Facility-Wide GMP are presented in Appendix B.

Version 8 of this GMP will be submitted to the Navajo Nation and Zuni Pueblo as a Final.

The initial 2008 Interim Measures Facility-Wide GMP, prepared by TerranearPMC for the USACE, Fort Worth District, describes the proposed groundwater monitoring to be

1 conducted as part of the Environmental Restoration Program at the FWDA. Section V.A.4 of
2 the Permit (NMED, 2005/2014) requires subsequent annual updates and revisions to the
3 Interim Measures Facility-Wide GMP. Versions 3, through 7 of the Interim Measures
4 Facility-Wide GMP represent the updates for CYs 2009 through 2013, respectively. The
5 original 2008 GMP was approved by NMED and subsequent plans have been submitted
6 annually.

8 ***1.2 Purpose and Objectives***

9 The purpose of Version 8 of the Interim Measures Facility-Wide GMP is to perform a
10 comprehensive assessment of the previous versions of the GMP and to provide
11 recommendations for changes and enhancements. The fundamental objectives for the FWDA
12 groundwater monitoring program are as follows:

- 14 • Evaluate compliance with the Permit groundwater cleanup levels, as identified in
15 Section 7.1 of Attachment 7 to the Permit (NMED, 2005/2014).
- 16 • Identify changes in ambient chemical conditions that affect fate and transport.
- 17 • Evaluate groundwater elevations to determine hydraulic gradients and groundwater
18 flow paths.
- 19 • Monitor temporal changes and detect the movement of contaminants of interest
20 (COIs) from one location to another.

21 COIs are chemicals that exceed or are likely to exceed the groundwater cleanup levels and
22 are associated with known historical waste management activities. Meeting these objectives
23 will support selection of appropriate corrective measures for the FWDA.

24
25 This Interim Facility-Wide GMP proposes the tasks below to fulfill the interim measures
26 required by the Permit (NMED, 2005/2014):

- 28 • Collect quarterly groundwater elevation data from all existing and active monitoring
29 wells.
- 30 • Collect groundwater samples from active monitoring wells using the methods
31 described in Section 4.2 and submit groundwater samples for specific chemical
32 analyses.

- 1 • Containerize and manage purge water as investigation-derived waste (IDW)
2 following the procedures outlined in Section 4.5.

3 **1.3 Work Plan Organization**

4 This 2015 Interim Measures Facility-Wide GMP is organized as follows:

- 5
6 • **Section 2**—Presents the available site history and general description of the FWDA
7 facility and summarizes previous groundwater investigations.
- 8 • **Section 3**—Presents the current site conditions and environmental setting of the
9 FWDA.
- 10 • **Section 4**—Details the procedures for groundwater sample collection,
11 decontamination, quality assurance, and IDW characterization and disposal.
- 12 • **Section 5**—Discusses the groundwater monitoring program objectives, data
13 validation, data management, and reporting.
- 14 • **Section 6**—Provides the projected sampling schedule for CY 2015/2016.

2. SITE HISTORY AND BACKGROUND

2.1 General Description

The FWDA (or Facility) currently occupies approximately 24 square miles (15,277 acres) of land in western New Mexico in McKinley County (Figure 2-1). The FWDA is located approximately 7 miles east of Gallup and about 130 miles west of Albuquerque. The main entrance to the FWDA is on U.S. Highway 66, west from Exit 33 off Interstate 40. The Facility is surrounded by federally owned and administered lands, including national forests, Zuni tribal lands, and Navajo tribal lands. North and west of the FWDA are Navajo trust and Native American allotted lands, to the east are lands that are administered by the Bureau of Indian Affairs, and to the south and southeast is the undeveloped Cibola National Forrest.

Originally founded in 1860 as a cavalry post, the U.S. Army established Fort Wingate as a munitions storage depot in 1918. The FWDA installation has had a number of missions since then, including ordnance storage, testing, and demilitarization, as well as missile defense testing.

The installation was closed in 1993 under the Defense Authorization Amendments and Base Realignment and Closure (BRAC) Act of 1988. In 2002, the Army reassigned many functions at FWDA to the BRAC Division, including: property disposal, caretaker duties, management of caretaker staff, and performance of environmental restoration and compliance activities. Facilities at FWDA include 732 earth-covered igloos located throughout the post, two former OB/OD areas, a workshop area, and various mission-support service structures located in the administration area.

At the present, approximately half of the FWDA is leased to the Missile Defense Agency and is used for operations related to missile testing. The remaining FWDA operations are focused on assessment and remediation of contamination resulting from past military activities. Efforts to remediate affected areas have concentrated on the removal of exploded and unexploded ordnance, in addition to characterizing soil across the installation and conducting semi-annual groundwater monitoring. The installation can be divided into several areas based upon location and historical land use. These major land-use areas include the following (Figure 2-2):

- **The Administration Area**—Located in the northern portion of the installation and encompasses approximately 800 acres; consists of former office facilities, housing, equipment maintenance facilities, warehouse buildings, and utility support facilities.

- **The Workshop Area**—Located south of the Administration Area and encompasses approximately 700 acres; consists of an industrial area containing former ammunition maintenance and renovation facilities, the former trinitrotoluene (TNT) washout facility, and the TNT Leaching Beds Area.

- **The Magazine (Igloo) Area**—Located in the central portion of the installation and covers approximately 7,400 acres; consists of areas that encompass 10 Igloo Blocks (A through H, J, and K) that contain 732 earth-covered igloos and 241 earthen revetments previously used for munitions storage.

- **The OB/OD Area**—Located within the southwest and western portions of the installation; the OB/OD Area can be separated into two sub-areas based on period of operation:
 - **Closed OB/OD Area**—Inactive OB/OD unit that was used to treat military munitions and explosive-contaminated waste from 1948 to 1955; includes the Old Burning Ground, the Demolition Landfill Area, and the Old Demolition Area (PMC, 1999).

 - **Current OB/OD Area**—Inactive OB/OD unit where burning and detonation operations were performed after 1955 until installation closure in 1993 (PMC, 1999); contains the OB/OD Unit Hazardous Waste Management Unit identified in the Permit.

- **Protection and Buffer Areas**—Located adjacent to the eastern, northern, and western boundaries of the installation and encompasses approximately 4,050 acres; consists of buffer zones surrounding the former magazine and demolition areas.

At present, FWDA has been undergoing final environmental restoration prior to property transfer/reuse. As part of the planned property transfer to the Department of Interior (DOI), the installation has been divided into reuse parcels with each site being addressed on a parcel-by-parcel basis, as specified by the Permit (NMED, 2005/2014). Parcels transferred to date are located near the southern and eastern boundaries of the installation and consist of Parcels 1, 15, and 17.

2.2 Previous Groundwater Investigations

Environmental restoration activities at the FWDA began in 1989 under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) guidelines, as part of the Installation Restoration Program. The one exception was the OB/OD Area, which proceeded under RCRA guidelines. During the period from 1980 through issuance of the Permit in December 2005 (revised April 2014), a number of environmental investigations were conducted by the Army and other parties (e.g., U.S. Environmental Protection Agency [EPA] and DOI) under CERCLA and RCRA guidance (BRAC, 2010).

Since that time, NMED has become the lead regulatory agency, and in 2002, NMED determined that the remediation pathway would be solely through a RCRA permit for post-closure care of the OB/OD Area, with a RCRA corrective action module attached to address requirements for other sites/parcels. The Permit (NMED, 2005/2014) was finalized in December 2005 and became effective 31 December 2005. The 2005 RCRA permit identified one Hazardous Waste Management Unit within the Current OB/OD unit (Parcel 3), and a total of 93 Solid Waste Management Units (SWMUs) and Areas of Concern (AOCs).

Since the 1980s, a number of groundwater investigations have been completed at the FWDA. Generally, these investigations have been conducted with multiple phases to iteratively characterize groundwater at a single location over a period of time. Currently, 104 groundwater monitoring wells have been installed to characterize the nature and extent of contamination from activities associated with the OB/OD unit and various SWMUs and AOCs. While a majority of the wells are sampled, some are dry (5), buried (3), damaged (1), or plugged and abandoned (10), and therefore, are not currently being sampled (Table 2-1).

Groundwater investigation and characterization efforts have primarily focused on five areas:

- TNT Leaching Beds Area (SWMU 1 located within Parcel 21),
- Administration Area (multiple SWMUs and AOCs located in Parcels 6, 7, and 11),
- Eastern Landfill Area (SWMU 13 located within Parcel 18),
- Buildings 542 and 600 Area (SWMUs 11 and 4 located within Parcel 6), and
- OB/OD Area (located within Parcel 3).

For discussion purposes related to groundwater sampling, these areas have been grouped within two major areas at the Facility: the OB/OD Area and the Northern Area. A map showing all existing monitoring well locations is included on Figures 2-3 through 2-5, well construction information for all wells to date is included in Table 2-1, and a Microsoft Excel®

1 spreadsheet of all groundwater analytical results through April 2014 is included in Appendix
2 C.

4 **2.2.1 Environmental Survey of FWDA – 1981**

5 In 1981, an environmental survey of FWDA (ESE, 1981) was conducted to determine the
6 potential presence and extent of contamination caused by activities related to munitions
7 storage, munitions recycling, and treatment. The following describes the activities related to
8 groundwater monitoring:

- 10 • Eleven monitoring wells (FW07, FW08, FW10, FW11, FW12, FW13, FW26, FW27,
11 FW28, FW29, and FW35) were completed in the Northern Area during this
12 assessment. However, groundwater was not encountered in the majority of the wells,
13 thus most of these wells are considered dry and have been abandoned.
- 15 • One monitoring well (FW24), located near a north-south trending arroyo that drains
16 into the OB/OD Area, was completed as part of the environmental survey of the
17 OB/OD Area in 1981. Upon completion of the installation of FW24, the well had
18 insufficient water for sampling and is considered dry and inactive.
- 20 • One background monitoring well, FW31, was completed east and south of any known
21 potentially contaminated areas during the 1981 environmental survey. This well is
22 near the former Pistol Range, over 10,000 feet southeast of the TNT Leaching Beds
23 Area, and over 14,000 feet northeast of the OB/OD Area. This well is active and is
24 currently being sampled on a semi-annual basis.

25
26 Unfortunately, most of the wells completed during the 1981 Environmental Survey have
27 historically lacked sufficient water for interim semi-annual sampling as directed by the
28 Permit.

30 **2.2.2 Groundwater Investigations at Building 6 UST Area – 1993-1995**

31 During January 1993, six underground storage tanks (USTs) were removed from Building 6
32 within the Administration Area (USACE, 1995a). During the removal, a fuel release was
33 suspected, presumably from holes or cracks in the bottoms of several of the tanks or
34 associated piping. This spill was discovered on 19 January 1993 and reported to the NMED,
35 Petroleum Storage Tank Bureau (USACE, 1995a).

1 The USACE, Albuquerque District, conducted a site investigation for the Building 6 USTs.
2 In 1993, 16 soil borings were advanced to an average depth of 60 feet below ground surface
3 (bgs). Based on the laboratory and field results from the 16 soil borings, the vertical extent of
4 the contamination appeared to be limited by a continuous clay layer occurring at
5 approximately 40 feet bgs. The horizontal extent of the soil contamination appeared to be
6 limited to within 250 feet downgradient of the former USTs. These results were submitted to
7 the NMED in June 1993. After reviewing these results, the NMED requested in January 1994
8 that the investigation be expanded to better define the vertical and horizontal extent of the
9 soil contamination and to determine if diesel products have significantly contaminated the
10 shallow alluvial aquifer.

11
12 In October and November 1994, six soil borings were advanced to a depth of 60 feet bgs, and
13 five monitoring wells were installed at three locations (MW-18S, MW-18D, MW-20,
14 MW-22S, and MW-22D). Groundwater analytical data from MW-20, located south and west
15 of the UST removal area, indicated benzene contamination of 110 micrograms per liter
16 ($\mu\text{g/L}$), well above the state action level of 10 $\mu\text{g/L}$ for benzene in groundwater. These
17 monitoring wells were resampled in December 1994, and laboratory analysis indicated that
18 the same well (MW-20) was still contaminated with benzene, but at a lower level of 59 $\mu\text{g/L}$.
19 A soil gas survey was conducted in the UST area in March 1995 to better define the location
20 of the benzene contamination in the vicinity of MW-20; however, benzene was not found in
21 the soil at depths between 35 to 50 feet in that area. The monitoring wells were also
22 resampled during the soil gas survey, and laboratory analytical data indicated that the
23 benzene level in MW-20 had decreased to 4.4 $\mu\text{g/L}$ (USACE, 1995b).

24
25 With the apparent steady decline in the benzene levels, the USACE, Albuquerque District,
26 approached the NMED to suspend the investigation and any further requirements to install
27 additional monitoring wells at this site. The NMED agreed that installation of additional
28 monitoring wells was not needed at that time; however, a 2-year quarterly groundwater
29 monitoring program was required to ensure that shallow groundwater quality has not been
30 compromised (USACE, 1995b).

31 32 ***2.2.3 Remedial Investigation/Feasibility Study Report and RCRA Corrective Action*** 33 ***Program Document – 1997***

34 Environmental investigation activities at FWDA were implemented as part of base closure in
35 the Fall of 1992 to determine the environmental impact (if any) from previously identified
36 SWMUs and AOCs, and to identify areas requiring environmental restoration prior to
37 property transfer to the DOI. Findings generated as a result of this effort were documented in
38 the 1997 Remedial Investigation/Feasibility Study Report and RCRA Corrective Action

1 Program Document (ERM PMC, 1997); groundwater activities and findings are summarized
2 below:

- 3
- 4 • Four groundwater monitoring wells (TMW01 through TMW04) were completed
5 during 1996 to further characterize groundwater contamination near the TNT
6 Leaching Beds Area in the Northern Area. Monitoring wells TMW01, TMW03, and
7 TMW04 were completed between 60 and 75 feet bgs in the unconsolidated material
8 overlying the mudstone/sandstone bedrock. Monitoring well TMW02 was completed
9 to a depth of approximately 85 feet bgs into a sandstone water-bearing unit that
10 underlies the TNT Leaching Beds Area.
- 11
- 12 • A single well (SMW01) was installed in 1996 to monitor potential impacts from the
13 Sewage Treatment Plant also in the Northern Area. This well was completed in the
14 unconsolidated alluvium overlying the mudstone/sandstone bedrock located in the
15 most northern portion of the FWDA.
- 16
- 17 • A single well (FW38) was completed during November 1993 in an arroyo that drains
18 the Current OB/OD Area. This well was completed to approximately 7.5 feet bgs in
19 the unconsolidated alluvium overlying the mudstone/sandstone bedrock. This well is
20 currently dry and is considered inactive.
- 21

22 During this phase of investigation, explosives and nitrate were the primary constituents
23 detected in the monitoring wells completed near the TNT Leaching Beds Area. Nitrate,
24 pesticides, and metals were the primary constituents detected in the samples collected from
25 SMW01 near the FWDA sewage treatment plant. Explosives, nitrate/nitrite, and metals were
26 the primary constituents detected in groundwater samples collected from FW38.

27

28 **2.2.4 Minimum Site Assessment Report – 1998**

29 The purpose of the Minimum Site Assessment (USACE, 1998) was to provide a summary of
30 the actions taken by the USACE, Albuquerque District, to identify the horizontal and vertical
31 extent of soil contamination and to determine if groundwater was impacted by potential fuel
32 releases at the UST site adjacent to Building 45.

33

34 The Minimum Site Assessment was initiated in November 1996 with the completion of six
35 soil borings (SB-1 through SB-6) and three shallow monitoring wells (MW01, MW02, and
36 MW03) to determine the extent of hydrocarbon contamination. Analytical data from this
37 assessment indicated that hydrocarbon contamination in the soil was limited to a small area.
38 The area affected was restricted to a single soil boring at depths less than 40 feet bgs.

1 Chemical characterization of underlying groundwater indicated minimal impact with a single
2 detection of benzene at a low concentration at MW01.

4 ***2.2.5 RCRA Interim Status Closure Plan – OB/OD Area Phase 1B Report - 1999***

5 Environmental characterization efforts in support of closure at the OB/OD Area were
6 conducted during CYs 1996, 1997, 1998, and 1999. Overall, these efforts consisted of
7 monitoring well installation and sampling, a seismic profile survey, groundwater elevation
8 measurements, a well survey, geologic mapping, surface water sampling, and sediment
9 sampling (PMC, 1999).

10
11 The objective of the 1996 investigation was to assess the presence and quality of shallow
12 groundwater and to characterize the shallow hydrogeologic regime in the OB/OD Area. This
13 investigation consisted of drilling and sampling of multiple soil borings; completion of
14 shallow and intermediate depth monitoring wells; performance of down-hole video logging
15 and slug tests on newly installed monitoring wells; and collection of groundwater, surface
16 water, and sediment samples. Three groundwater monitoring wells (KMW09, KMW10, and
17 KWM11) were installed in the Closed OB/OD Area and eleven groundwater monitoring
18 wells (CMW02, CMW04, CMW06, CMW07, CMW10, CMW14, and CMW16 through
19 CMW20) were installed in the Current OB/OD Area. Explosive constituents were detected in
20 wells located in both OB/OD areas; however, the areal extent could not be defined by the CY
21 1996 investigation and required further characterization efforts.

22
23 Subsurface characterization measures were conducted during CY 1997 to obtain additional
24 data concerning the stratigraphy and structural setting of the OB/OD Area. This investigation
25 consisted of a surface seismic survey, geologic mapping, and fracture trace analysis. From
26 this and previous investigations, two groundwater systems within the two OB/OD areas were
27 identified: the shallow, unconsolidated water-bearing zone and the deeper, bedrock water-
28 bearing zone (PMC, 1999).

29
30 In 1998, two groundwater monitoring wells (KMW12 and KMW13) were installed within
31 the Closed OB/OD Area, and four groundwater monitoring wells (CMW21, CMW22,
32 CMW23, and CMW25) were installed north of monitoring well CMW16 located in the
33 Current OB/OD Area to identify the northern extent of impacted groundwater within the
34 unconsolidated and bedrock water-bearing zones. In addition, CMW24 was installed
35 northwest of CMW16 to determine if previously identified faults act as a groundwater flow
36 barrier or conduit, and to determine the direction of groundwater flow in that area (PMC,
37 1999).

1 **2.2.6 OB/OD Groundwater Monitoring – 1999 - 2005**

2 Several quarterly sampling events have been completed in the two OB/OD areas since the
3 issuance of the 1999 RCRA Interim Status Closure Plan - Phase 1B Report (PMC, 1999).
4 Quarterly groundwater monitoring events were conducted during CYs 2000 (PMC, 2001a),
5 2001 (PMC, 2002a), and 2002 (PMC, 2003), and an additional sampling event was
6 completed in August 2005 (TerranearPMC, 2005). These quarterly events were documented
7 in quarterly letter reports and an annual inclusive report for each year.

8
9 During the initial sampling investigation, a subset of nine wells (CMW02, CMW16,
10 CMW18, CMW21, CMW22, CMW25, KMW09, KMW12, and KMW13) was sampled
11 during CY 2000 and the first half of CY 2001. Monitoring well CMW23 was added midway
12 through CY 2001, and a subset of 10 wells was sampled until CY 2005.

13
14 **2.2.7 RCRA Facility Investigation Report of the TNT Leaching Beds Area – 2001**

15 From 1998 to 2001, additional groundwater investigations were completed in the TNT
16 Leaching Beds Area and the Administration Area (PMC, 2001b). Seven groundwater
17 monitoring wells (TMW05 through TMW08, TMW10, TMW11, and TMW13) were
18 installed to further characterize the hydrogeologic setting and potential environmental
19 impacts caused by the former operations. As a result of these investigations, groundwater
20 was found to be impacted by explosives, metals, nitrate, and nitrite, which appear to emanate
21 from the TNT Leaching Beds Area. In addition, groundwater was also found to be impacted
22 by pesticides and solvents, which appear to originate from the Administration Area.

23
24 **2.2.8 Phase 1 RCRA Facility Investigation Report for Buildings 600 and 542 – 2002**

25 In 2001, soil and groundwater were investigated to determine if previous detections of
26 explosives in TMW11 were the result of activities at Buildings 600 and 542 (Ammunition
27 Workshop) (PMC, 2002b).

28
29 Monitoring well TMW11, drilled in a location cross-gradient from the TNT Leaching Beds
30 Area, was intended to provide groundwater chemical characterization data in an area thought
31 to be unimpacted by historical operations. One explosive constituent,
32 cyclotrimethylenetrinitramine (1,3,5-trinitro-1,3,5-triazinane or RDX), was detected at
33 concentrations close to the laboratory method detection limit (DL) during five of six
34 sampling events conducted between October 1998 and January 2000. These detections of
35 RDX initiated an investigation to identify other potential sources of explosives in the area.

36

1 A total of six monitoring wells (TMW14A through TMW19) were completed near
2 Buildings 542 and 600 to determine the source of the contamination at TMW11. Monitoring
3 well TMW15 was completed in the unconsolidated water-bearing zone, similar to TMW11.
4 Monitoring wells TMW14A, TMW16, TMW17, TMW18, and TMW19 were completed in
5 the deeper, sandstone bedrock water-bearing zone. TMW14A was also installed as a potential
6 background well.

7
8 Overall, only low concentrations of a single volatile organic compound (VOC), explosives,
9 perchlorate, nitrate, nitrite, and a variety of metals were detected from samples collected
10 during this investigation.

11 12 **2.2.9 Groundwater Investigation Report of the Eastern Landfill – 2005**

13 The Eastern Landfill is located approximately ½ mile northeast of the water towers and is
14 reported to have been used for the disposal of garbage, trash, and debris from the
15 Administration Area, and for the burning of other solid waste from activities at the FWDA.
16 In 1968, the landfill was closed and covered with a layer of soil. During the Remedial
17 Investigation phase, the Eastern Landfill was located using a geophysical survey, and soil
18 sampling and a soil gas survey were conducted. The soil analytical results indicated that lead,
19 mercury, and barium were present at levels slightly above background levels. Pesticides,
20 VOCs and semivolatile organic compounds (SVOCs) were not detected. The results of the
21 soil gas survey indicated that low levels of methane were present; however, hydrogen sulfide
22 gas was not detected. In October 1999, Safe Environment, Inc. removed surface debris in the
23 area of the Eastern Landfill, which consisted of metal ammunitions lids, wire rope, I-beams,
24 pipe, tires, wire fencing, concrete blocks, expended ammunition casings, scrap wood, and
25 tree branches/trunks (TtNUS, 2005).

26
27 The primary objective of the 2005 groundwater investigation was to determine if
28 contaminants have impacted the groundwater beneath the Eastern Landfill (TtNUS, 2005).
29 During the investigation, four bedrock wells (EMW01 through EMW04) were completed to
30 depths ranging from 100 to 120 feet bgs in 2004. Immediately after installation, only two of
31 the four wells (EMW02 and EMW03) contained enough water for sampling (TtNUS, 2005).
32 Several explosives, metals, pesticides, VOCs, SVOCs, nitrate, and nitrite were detected in
33 these samples collected from the sampling event after well installation, with RDX, pesticides,
34 and dissolved metals detected above screening levels initially. ~~In 2014, the Eastern Landfill
35 was removed and wells EMW01, EMW02, EMW03, and EMW04 were abandoned as part of
36 the Interim Measure. The report is currently under review by NMED (NMED, 2014).~~

1 **2.2.10 Administration and TNT Leaching Beds Areas Supplemental Groundwater**
2 **Characterization Report – 2006**

3 The purpose of the work described in this report (TerranearPMC, 2006) was to gather
4 additional information during 2002 and 2003 to address comments and discussions by
5 members of the FWDA BRAC Cleanup Team regarding information presented in the 2001
6 Final RCRA Facility Investigation (RFI) for the TNT Leaching Beds Area (PMC, 2001b).

7
8 These prior discussions indicated that the downgradient flow of groundwater from the TNT
9 Leaching Beds Area to the north could possibly be split by the influence of a groundwater
10 mound that has been shown to exist within the Administration Area. In this scenario,
11 impacted groundwater could flow to the west-northwest and/or to the northeast around the
12 Administration Area, thus the existing monitoring wells, TMW06 and TMW07, would not be
13 properly placed to define the downgradient extent(s) of impacted groundwater. Therefore,
14 additional monitoring wells were required to evaluate this scenario. In addition, the
15 groundwater analytical data presented in the TNT Leaching Beds Area RFI Report indicated
16 that the leading edge of impacted groundwater (as indicated principally by detected
17 nitrite/nitrate concentrations) had reached the edge of the permeable sediments of the Rio
18 Puerco Valley. Because groundwater from these sediments is used for domestic water supply
19 in the immediate vicinity of the FWDA, additional efforts (monitoring wells and
20 groundwater samples) were warranted to determine the current groundwater quality within
21 the Rio Puerco sediments in the northern areas of the FWDA.

22
23 As a result, nine monitoring wells (TMW21 through TMW29) were installed and screened
24 within the unconsolidated water-bearing zone. Upon completion of the new wells, a
25 groundwater sampling event of all wells in the Northern Area of FWDA was conducted
26 during October 2002 and April 2003. The results of this event were similar to those of the
27 2001 RFI Report of the TNT Leaching Beds Area and provided further information about the
28 leading edges of impacted groundwater.

29
30 **2.2.11 Parcel 11 RFI Report – 2011**

31 In November and December of 2009, the U.S. Geological Survey (USGS) conducted an RFI
32 in Parcel 11. Three monitoring wells were installed within Parcel 11 at SWMU 5 (TMW35,
33 near Building 5), SWMU 6/AOC 47 (TMW34, west of Building 11), and SWMU 45 (USGS,
34 2011a). The SWMU 45 monitoring well (TMW33) was installed downgradient of former
35 UST locations near Building 6 (USGS, 2011a). All three monitoring wells were constructed
36 in the alluvium and in accordance with NMED guidance with the water table no less than
37 5 feet below the top of the screen.

1
2 Groundwater samples were collected in April 2010 during the scheduled semi-annual
3 groundwater monitoring activities. No diesel fuel constituents were detected, but VOCs and
4 nitrate were detected in samples with concentration above screening criteria. The screening
5 level for nitrate is 10 milligrams per liter (mg/L). TMW34 and TMW35 samples contained
6 nitrate at 177 mg/L and 84.5 mg/L, respectively (USGS, 2011a). Of the VOCs detected,
7 1,2-dichloroethane was detected in groundwater from TMW33 above the screening level of
8 5 µg/L. The groundwater sample collected from TMW33 had a 1,2-dichloroethane
9 concentration of 30.7 µg/L (USGS, 2011a).

10 11 **2.2.12 Parcel 22 RFI Report – 2011**

12 In November and December of 2009, the USGS installed six monitoring wells as part of the
13 RFI for Parcel 22 to investigate the suspected release of perchlorate originating from TPL,
14 Inc. (a former tenant) operations related to demilitarization of munitions within SWMU 27
15 (USGS, 2011b). Five of the monitoring wells were completed within the sandstone water-
16 bearing unit (TMW30, TMW31D, TMW32, TMW36, and TMW37), and one monitoring
17 well was installed in alluvium (TMW31S). In addition, TMW31S and TMW31D were
18 installed as dual-completion wells (two monitoring wells constructed in one borehole).
19 TMW30 was a replacement monitoring well for TMW05 (dry since 2008), and TMW31S
20 was installed as a replacement monitoring well for FW10, which is also dry.

21
22 Groundwater samples were collected in April 2010 during the scheduled semi-annual
23 groundwater monitoring activities. Groundwater samples collected from monitoring wells
24 TMW30, TMW31D, and TMW31S contained nitrate above the screening level of 10 mg/L
25 with concentrations of 89.1 mg/L, 59.0 mg/L, and 35.0 mg/L, respectively (USGS, 2011b).
26 Groundwater samples collected from monitoring wells TMW30, TMW31D, TMW31S, and
27 TMW32 contained perchlorate concentrations exceeding the screening level of 6 µg/L with
28 concentrations of 1,900 µg/L, 1,420 µg/L, 465 µg/L, and 232 µg/L, respectively (USGS,
29 2011b).

30 31 **2.2.13 Monitoring Well Installation and Abandonment Work Plan – 2011**

32 The purpose of this work plan is to describe the work performed by the USGS on behalf of
33 the USACE, Fort Worth District, as part of the Environmental Restoration Program at
34 FWDA. The plan describes the installation of up to 18 groundwater monitoring wells and the
35 abandonment of 10 groundwater monitoring wells. This work was performed to further
36 delineate groundwater contaminant plumes, establish background concentration levels,

1 monitor potential off-site migration, and remove from service several dry monitoring wells
2 (USGS, 2011c).

3
4 Wells were installed at locations selected to address one of the following three objectives:

- 5 1) To monitor potential off-site migration of chemical constituents originating from
6 former post activities,
- 7 2) To determine background concentrations of major and trace metals, and
- 8 3) To add sufficient spatial data to further define the RDX, nitrate, and perchlorate
9 groundwater plumes.

10 **Well Installation**

- 11 • ***Sentinel Wells*** – Two alluvial sentinel monitoring wells (MW23 and MW24) were
12 installed in June and July 2011 at the request of the NMED. These two wells are
13 located in the northwest portion of the FWDA and were selected to monitor potential
14 off-site migration of chemical constituents within the alluvial aquifer (USGS, 2011c).
15
- 16 • ***Background Wells*** – Three background monitoring wells (BGMW01, BGMW02, and
17 BGMW03) were installed in February 2012 in the alluvial aquifer to determine the
18 background concentrations of major and trace metals in the groundwater. The purpose
19 of these wells is to determine the natural concentrations of constituents that reflect the
20 naturally occurring water-rock interactions with the alluvial unit, as well as
21 atmospheric inputs, clay mineralogy, pH, and water chemistry (USGS, 2011c).
22
- 23 • ***Perchlorate Plume Monitoring Wells*** – Alluvial monitoring wells (TMW39S,
24 TMW40S, TMW41) were installed in July and September 2011 to aid in delineating
25 the lateral extent of the perchlorate plume. Three bedrock monitoring wells (TMW38,
26 TMW39D, and TMW40D) were also installed to define the lateral extent of the
27 bedrock perchlorate plume (USGS, 2011c).
28
- 29 • ***RDX Plume Monitoring Wells*** – Three alluvial monitoring wells (TMW43, TMW44,
30 and TMW45) were installed in the Northern Area in February 2012. Monitoring
31 wells, TMW43 and TMW44, were installed to refine the concentration gradient in the
32 center of the RDX plume and to allow for contaminant mass discharge estimates.
33 These monitoring wells will also aid in defining the concentration gradient of nitrate
34 in the alluvium, which comingles with the RDX plume. Monitoring well TMW45 was

1 installed north of TMW23 to delineate the northern extent of the RDX plume (USGS,
2 2011c).

- 3
- 4 • **Nitrate Plume Monitoring Wells** – Two alluvial monitoring wells (TMW46 and
5 TMW47) were installed in February 2012 to provide chemical data that will delineate
6 the northwest and eastern boundaries of the alluvial nitrate plume. Additionally,
7 because the nitrate alluvial plume comingles with the RDX plume and alluvial
8 perchlorate plume, monitoring wells installed to characterize these plumes will also
9 be used to further characterize the alluvial nitrate plume (USGS, 2011c).

10

11 **Well Abandonment**

12 Ten groundwater monitoring wells were plugged and abandoned in the summer of 2011
13 because these wells historically lacked sufficient groundwater volumes required for
14 groundwater sampling. These 10 wells were all located in the Northern Area and were
15 generally screened within the alluvium. The following list dictates which wells were plugged
16 and abandoned:

17

| Well ID | Northing ^a | Easting ^a | Casing Diameter (inches) | Well Depth (feet) |
|---------|-----------------------|----------------------|--------------------------|-------------------|
| TMW05 | 1639949.83 | 2498884.78 | 2.0 | 37.40 |
| FW07 | 1640839.18 | 2498075.06 | 4.0 | 30.50 |
| FW08 | 1640572.50 | 2498132.47 | 4.0 | 51.00 |
| FW10 | 1640848.95 | 2498936.89 | 4.0 | 51.50 |
| FW11 | 1641334.02 | 2499124.16 | 4.0 | 28.00 |
| FW12 | 1641609.82 | 2499038.13 | 4.0 | 29.00 |
| FW13 | 1641688.39 | 2498830.01 | 4.0 | 30.50 |
| FW27 | 1646461.42 | 2494395.93 | 4.0 | 32.00 |
| FW28 | 1646584.14 | 2493050.57 | 4.0 | 33.00 |
| FW29 | 1645804.02 | 2497681.98 | 4.0 | 32.00 |
| EMW01 | 1643655.61 | 2502045.53 | 2.0 | 120.70 |
| EMW02 | 1643391.22 | 2502476.99 | 2.0 | 120.00 |
| EMW03 | 1643687.88 | 2502800.30 | 2.0 | 100.00 |
| EMW04 | 1643815.18 | 2502419.30 | 2.0 | 120.00 |

20

21 **2.2.14 Semi-Annual RCRA Groundwater Monitoring Reports and Updated Groundwater**
22 **Monitoring Plans – Ongoing**

23 In accordance with Section V.A of the Permit (NMED, 2005/2014), the 2008 Interim
24 Measures Facility-Wide GMP was prepared, approved by NMED, and implemented. Since

1 2008, groundwater sampling was conducted semi-annually (April and October), and semi-
2 annual groundwater monitoring reports were prepared, providing the analytical data and
3 water level maps for FWDA.

4

5 In addition, the Interim Measures Facility-Wide GMP is updated annually and is required to
6 propose changes to the groundwater monitoring program annually. Section 5 provides the
7 proposed changes to the 2015/2016 monitoring program.

8

3. SITE CONDITIONS

The general information below is a summary of the site conditions at the FWDA. More specific information including historic land use, natural and man-made features, ecological setting, fate and transport information, and detailed surface and subsurface characterization will be included in other documents (e.g., RFI Work Plans and Release Assessment Reports) prepared for the individual parcels as specified in the Permit.

3.1 Climate

Northwestern New Mexico is characterized by a semi-arid, continental climate with most precipitation occurring during the months of May through September as localized, heavy, and brief monsoon storms. The climate for the FWDA area varies with elevation but is generally mild during the summer with temperatures ranging between 65 and 95 degrees Fahrenheit (°F), and cold during the winter with average daily temperatures ranging between 30 and 35°F. The warmest month of the year is July with an average maximum temperature of 89°F, while the coldest month of the year is December with an average minimum temperature of 11°F. Daily temperature variations can be considerable during the summer months with an average temperature difference of approximately 35°F.

Mean annual rainfall for the area ranges between 10 and 16 inches, while the recorded average annual precipitation for the FWDA is approximately 11 inches. The wettest month of the year is August with an average rainfall of approximately 2 inches. Most of the precipitation occurs as rain or hail during violent summer thunderstorms; the remainder results from light winter snow accumulations with the slow release of spring snowmelt, which provides higher infiltration compared to the intense monsoon thunderstorms (Anderson *et al.*, 2003).

The area has generally sunny weather with average relative humidity varying from 50 to 15 percent during the wet season (summer monsoons) and the dry season, respectively. During spring, the area experiences very strong winds originating from the west and southwest with an average wind speed of approximately 12 miles per hour and maximum gust speeds approaching 65 miles per hour. These strong winds, high temperatures, and low relative humidities contribute to high evaporation rates at the FWDA.

1 **3.2 *Topography***

2 Topographically, the FWDA can be divided into three areas: (1) the rugged north-south
3 trending Nutria Monocline (commonly referred to as the Hogback) along the western and the
4 southwestern boundaries of the installation; (2) the northern hill slopes of the Zuni Mountain
5 Range in the southern portion of the installation; and (3) the alluvial plains marked by
6 bedrock remnants in the northern portion of the installation. The elevation of FWDA ranges
7 from approximately 8,200 feet above mean sea level in the south to 6,660 feet above mean
8 sea level in the north.

9
10 This climate and topography supports a mixed ponderosa pine and fir forest at elevations
11 above 7,500 feet, piñon and juniper vegetation at elevations from 7,500 to 6,800 feet, and
12 shrubs and grasses at elevations below 6,800 feet.

13
14 **3.3 *Soil***

15 The FWDA soil types range from a mixture of sand, silt, and clay. Alluvium most commonly
16 found in arroyos is permeable sand and sandy loam clay mixtures that contain varying
17 amounts of silt, gravel, and rock fragments; however, most soil across the Facility is
18 composed of low-permeability sandy clay. Soil types at the FWDA are primarily alluvial
19 materials with the exception of the Hogback along the western border and the northern hill
20 slopes of the Zuni Mountain Range in the southern portion of the installation. The alluvial
21 materials do not have distinct soil horizons as they are relatively shallow and undeveloped,
22 excluding the arroyos, and the parent bedrock is either at or near the surface within more than
23 a quarter of the installation.

24
25 High winds and water cause extensive soil erosion, especially where the vegetation cover is
26 absent. The more permeable, sandy soil typically found in arroyos accounts for the majority
27 of local surface water infiltration. The thickness of the soil varies across the installation. In
28 the OB/OD Area and at the eastern and southern perimeter of the Northern Area, the soil
29 thickness is a thin veneer with parent bedrock at or near the surface. However, in the majority
30 of the Northern Area, the flat alluvial plains are dominant with thick soil overlying deeper,
31 steeply dipping bedrock. In the Administration Area alone, alluvium can be up to 70 feet
32 thick and are even thicker near the Rio Puerco.

33

1 **3.4 Geology**

2 **3.4.1 Regional Geology Tectonic Setting and Site-Specific Structure**

3 The FWDA is located in an erosional basin within the Navajo section of the Colorado
4 Plateau Physiographic Province and lies on the northwest apex of the Zuni Uplift. This basin
5 is regionally bounded by the Gallup Sag to the west, the Acoma Sag and McCarty’s Syncline
6 to the east, and the Chaco Slope to the north. The Zuni Uplift is an elongated north-northwest
7 trending structural uplift that is primarily a result of vertical upward displacement followed
8 by deformation resulting from horizontal compressive stress associated with the Laramide
9 Orogeny (Cretaceous). The uplift has exposed tilted Mesozoic sedimentary strata within the
10 south-western portion of the installation, a majority of which are Triassic mudstones and
11 sandstones.

12

13 Specifically, the dominant topographic structural feature located on the southwest margin of
14 the Zuni Uplift is the Nutria Monocline or “Hogback.” This steep structural feature is a
15 monoclinal belt with dips ranging from 30 to 45 degrees near the Facility. Dips commonly
16 exceed 60 degrees in the southern extension of the monocline, south of the Facility. The
17 northern segment of the Nutria Monocline is exposed in the western portion of the FWDA,
18 where westerly dipping Mesozoic strata is exposed to form a long, sharp-crested, north-to-
19 south trending ridge. In areas of the installation east of the Hogback, the bedrock generally
20 dips to the northwest.

21

22 **3.4.2 Stratigraphy**

23 In the northern portion of the installation, the surface is covered by either remnants of the
24 Chinle Group (Triassic) or alluvial deposits (Quaternary). The majority of the alluvial
25 deposits are mostly prevalent in the Northern Area in lowland areas between bedrock
26 remnants. Alluvial deposits are also present along intermittent streams draining the Hogback
27 and Zuni Mountains, which flow downgradient through the northern portion of the
28 installation before joining the South Fork of the Puerco River. The alluvium ranges in grain
29 size from clay to gravel, typical of braided stream deposits (Malcolm Pirnie, Inc., 2000).
30 Because the alluvium was generally deposited by braided streams and arroyos, the texture
31 and internal structure are characterized by lateral and vertical heterogeneity. Information
32 obtained from records of previously installed wells indicates that the alluvial deposits are
33 thickest near major drainages, such as the South Fork of the Rio Puerco, where alluvial
34 deposits can be up to 150 feet thick. Near Fort Wingate High School (located east of the
35 installation), the alluvial deposits are approximately 75 feet thick, whereas in the

1 Administration Area, deposit thickness is variable with average thickness varying from 30 to
2 70 feet within a relatively small spatial area.

3
4 The majority of the FWDA is underlain by the Chinle Group (Triassic), which is
5 predominantly non-marine, red-bed siliciclastics. The Chinle Group consists of the
6 Shinarump, Bluewater Creek, Petrified Forest, and the Owl Rock Formations. The Petrified
7 Forest Formation directly underlies the majority of the installation, and is subdivided into
8 three members: the Blue Mesa, the Sonsela, and the Painted Desert. All three members of the
9 Petrified Forest Formation outcrop in various locations across the installation. The Blue
10 Mesa, Sonsela, and Painted Desert lithologies are green-gray smectitic mudstone, light-gray
11 to yellowish-brown cross-bedded sandstone, and reddish-brown and grayish-red smectitic
12 mudstone, respectively. At the eastern extent of the FWDA installation, the older Bluewater
13 Creek and Shinarump Formations outcrop intermittently between Quaternary alluvium.

14
15 The Chinle Group is underlain by the older San Andres Limestone and Glorieta Sandstone,
16 both Permian in age. The San Andres Limestone generally consists of fossiliferous limestone
17 that intertongues the Glorieta Sandstone (Anderson *et al.*, 2003). These two formations do
18 not outcrop within the boundaries of the Facility; however, the Glorieta Sandstone Formation
19 does outcrop south of the installation where a thrust fault juxtaposes Permian strata against
20 the Cretaceous Dakota Sandstone. These two formations comprise the San Andres-Glorieta
21 aquifer and is the principal source of drinking water in the area (Malcolm Pirnie, Inc., 2000).
22 Figure 3-1 depicts the geology of the FWDA.

23 24 **3.5 Surface Water**

25 **3.5.1 General Surface Water**

26 Streams are ephemeral and fed by rain and snowmelt from the Zuni Mountain Range and the
27 Nutria Monocline. All drainages in the FWDA area are intermittent with flow only occurring
28 during and after heavy rainfall events (summer) or snowmelt (spring). These streams
29 transport sediment to low-lying areas in the northern portion of the installation, thus creating
30 thick and extensive alluvial deposits among remnants of Triassic strata of the Petrified Forest
31 Formation. Main drainages at the FWDA generally follow the dominant topography, flowing
32 from south to north and discharging into the South Fork of the Rio Puerco in the northern
33 portion of the installation. Because of the nature of brief and heavy precipitation in this semi-
34 arid region, the surface drainage is relatively shallow near headwaters. Downward erosion
35 intensifies as the water moves downstream, thus resulting in a well-developed, steep-walled
36 system of arroyos in Quaternary alluvium.

1 **3.5.2 Site-Specific Surface Water**

2 Three major drainage systems at the FWDA can be identified as follows: (1) eastern drainage
3 system; (2) western drainage system; and (3) southwestern corner drainage system. These
4 drainage systems are divided by either bedrock ridges or bedrock remnants. Furthermore, in
5 the northwest portion of the site, two artificial channels are present that were constructed
6 during the 1940s to divert water away from Igloo Blocks A and B and the Administration
7 Area (U.S. Department of Energy, 1990).

8
9 The eastern drainage system consists of washes that run in northwestern and northeastern
10 directions off the slopes of the Zuni Mountains. Alluvial fans form in basins at the front of
11 the slope, as well as between bedrock remnants. In the northeast section of the installation,
12 the drainage flows around bedrock remnants before joining the South Fork of the Puerco
13 River. The western drainage system (except for the southwest corner) consists primarily of
14 two main drainages covering the western portion of the FWDA. Tributaries of the western
15 drainage system pass the demolition area, cross the Hogback, and then join, flowing north
16 depositing alluvium along the bedrock remnants (Herndon Solutions Group, 2011). The
17 southwestern corner drainage system flows southwest and joins the Bread Springs Wash on
18 the western side of the Hogback. Because the southwestern corner drainage system is
19 hydrogeologically isolated from the other parts of the site and installation activities have
20 apparently not occurred in this area, the drainage system is of less environmental concern
21 (U.S. Department of Energy, 1990).

22
23 **3.6 Hydrogeology**

24 Groundwater is present in several of the rock units underlying FWDA. Examination of these
25 units and records of wells in the area indicates that the only formations at FWDA capable of
26 yielding more than a few gallons per minute (gpm) are the Quatowam Alluvium (Quaternary)
27 and the San Andres Limestone and Glorieta Sandstone (Permian). However, minor amounts
28 of groundwater are present in bedrock underlying the shallow alluvial aquifer and are
29 composed of Triassic-age members of the Chinle Group: the Painted Desert
30 Mudstone/Claystone, the Shinarump Conglomerate, and the Sonsella Sandstone. Water
31 yields from the Shinarump and Sonsella Members generally yield 5 to 50 gpm, and the water
32 quality is considered fair to poor. Water-bearing formations of Jurassic and Cretaceous ages
33 capable of yielding 100 gpm or more are present 4 to 6 miles to the west of FWDA, but not
34 within installation boundaries. The tilted bedrock underlying the majority of the FWDA
35 installation dips gently to the northwest, which substantially influences the movement of
36 groundwater. The groundwater flow gradient in the Northern Area is primarily to the south-

1 southwest in the alluvial system and to the west in the bedrock system. The groundwater flow
2 gradient appears to be in a northerly direction in the OB/OD Area.

3 4 **3.6.1 Productive Aquifers**

5 The Quaternary alluvial aquifer, which includes deposits in the Rio Puerco Valley along the
6 northern edge of the installation, is composed of gravel, sand, silt, and clay derived from
7 Triassic and Jurassic age strata that border the valley. This shallow aquifer is primarily
8 recharged from surface runoff, although some deposits in the southern part of the installation
9 are recharged by springs from underlying bedrock aquifers. Recharge of groundwater within
10 the alluvium occurs mainly during the wet seasons of the year, specifically with the
11 snowmelt in the spring.

12
13 The San Andres-Glorieta aquifer is the only groundwater source for the FWDA installation
14 and outcrops near the installation's southern boundary, dipping to the north. Snowmelt and
15 precipitation furnish much of the recharge water to the aquifer. The downgradient flow of
16 groundwater is in a northwesterly direction with the top of the San Andres-Glorieta aquifer
17 approximately 1,100 feet bgs near the Administration Area. At this location, the aquifer is
18 about 200 feet thick and under artesian pressure. Local variations in aquifer permeability can
19 be large and unpredictable with hydraulic conductivity values ranging from 0.05 to 150 feet
20 per day and yields that are highly variable from one location to another (Herndon Solutions
21 Group, 2011). In 1980, the region around Gallup, including FWDA, was declared an
22 underground water basin by the State of New Mexico. This action prohibits any major new
23 groundwater withdrawals without the approval of the State Engineer. The recharge basin for
24 this aquifer covers approximately 1,439 square miles and includes the communities of
25 Gallup, Fort Wingate, Camerco, Mariano Lake, Navajo Wingate Village, Zuni Pueblo, and
26 Rehoboth (Herndon Solutions Group, 2011).

27 28 **3.6.2 OB/OD Area Hydrogeology**

29 The general groundwater flow in the OB/OD Area is from south to north, following the
30 general topographic gradient (Herndon Solutions Group, 2011). Groundwater in the OB/OD
31 Area is mostly present in Triassic-age bedrock (Herndon Solutions Group, 2011) from the
32 Chinle Group. According to data presented in monitoring well logs, the majority of
33 monitoring wells in the OB/OD Area are constructed in undifferentiated Chinle units or the
34 Sonsela Member of the Petrified Forest Formation. Because groundwater is generally not
35 present in the alluvial deposits, groundwater can saturate the sediments that load arroyos
36 generally only during and after substantial precipitation. Monitoring wells CMW20 and

1 FW38 are constructed in arroyo sediment. FW38 is a dry well, and CMW20 only periodically
2 contains sufficient groundwater to sample (Herndon Solutions Group, 2011).

3 ***3.6.3 Northern Area Hydrogeology***

4 In the northern portion of the installation, the alluvium is thicker than in the OB/OD Area,
5 thus has a higher storage capacity for groundwater. Saturated thickness within the alluvial
6 aquifer (Quatowam Alluvium) varies greatly and tends to increase as it nears drainage
7 channels and arroyos. The direction of general groundwater flow is from the north toward the
8 south. However, directly beneath the Administration Area, groundwater flow from the north
9 converges with groundwater flow from the southern edge of the Workshop Area. This
10 convergence creates a local westerly groundwater flow direction (Herndon Solutions Group,
11 2011).

12
13 In addition, groundwater is also present in bedrock beneath the Workshop Area in
14 discontinuous fine-grained, sandstone beds within the Painted Desert Member of the Petrified
15 Forest Formation. Several monitoring wells are constructed with screens in these sandstones,
16 and groundwater elevation measurements indicate that the downgradient is in a westerly
17 direction (Herndon Solutions Group, 2011).

18 19 ***3.7 Cultural Resources***

20 Traditional Cultural Properties and other cultural resources have been documented within
21 FWDA boundaries. Existing groundwater monitoring wells and access routes are not located
22 within identified archaeological sites. Because groundwater sampling activities are non-
23 intrusive and confined to a small area immediately surrounding a given well, cultural
24 resource monitoring will not be required during proposed sampling activities at existing
25 wells.

26
27 Maps showing the locations of Traditional Cultural Properties relative to existing monitoring
28 well locations will not be included in this Interim Measures Facility-Wide GMP, which will
29 be a public document when final.

THIS PAGE INTENTIONALLY LEFT BLANK

4. SITE MONITORING AND SAMPLING METHODS

Field activities to be performed under this Interim Measures Facility-Wide GMP include groundwater elevation surveys and collection of groundwater samples from the monitoring wells at FWDA. The various types of purge methods required for sampling are identified in Table 4-1 and described in the following sections. Field equipment required for the following field activities is listed in Table 4-2. The Site Safety and Health Plan for this investigation is included in Appendix D.

Project organization is the following:

4.1 Groundwater Elevation Survey

Groundwater elevation measurements in the existing wells listed in Table 4-1 will be measured quarterly over a two-day period (January, April, July, and October). When a groundwater elevation survey event coincides with a groundwater sampling event, water elevation data shall be collected prior to the start of sample collection.

Depth to groundwater shall be measured with an electronic water-level meter as follows:

- 1 • Slowly lower the probe of the water-level meter down into the well casing in order to
2 minimize groundwater disturbance.
- 3 • Record measurement to the nearest 0.01 foot from the top-of-casing reference notch
4 and document in field logbook.
- 5
- 6 • Remove water level probe from the well casing and decontaminate with Liquinox[®]
7 and deionized water as described in Section 4.4. Use of any other type of detergent
8 will be documented in the field logbooks and investigative reports.
- 9

10 **4.2 Groundwater Sampling**

11 Groundwater will be sampled from the monitoring wells listed in Table 4-1 in order of
12 increasing chemical concentration (known or anticipated) and analyzed for the constituents
13 of interest outlined in Section 5.3. Sample bottles will be filled in the following order:
14

| Analytical Group | Analytical Method* | Container (Number, Size, and Type) |
|--|--------------------|---------------------------------------|
| TCL VOCs | 8260C | (3) - 40 mL VOC glass vials |
| TCL SVOCs | 8270D | (1) - 1-L amber bottle |
| TPH-GRO | 8015C | (3) - 40 mL VOC glass vials |
| TPH-DRO | 8015C | (1) - 1-L amber bottle |
| Explosives | 8330B | (2) - 1-L amber bottles |
| Nitrate | 300.0 | (1) - 250-mL poly bottle |
| Nitrite | 300.0 | (1) - 500-mL poly bottle |
| Perchlorate | 6860 | (1) - 250-mL poly bottle |
| Pesticides | 8081B | (2) - 1-L amber bottle |
| Total Metals and Mercury (unfiltered) | 6010C/6020A/7470A | (1) - 1-L poly bottle |
| Dissolved Metals and Mercury (filtered) | 6010C/6020A/7470A | (1) - 1-L poly bottle |

15 *- The most current recently published versions of the methods will be used.

16 L = liter

17 mL = milliliter

18 SVOC = semi-volatile organic compound

19 TCL = target compound list

20 TPH-DRO = total petroleum hydrocarbon - diesel range organics

21 TPH-GRO = total petroleum hydrocarbon - gasoline range organics

22 VOC = volatile organic compound

23

24 Samples will be analyzed at Test America, Denver located in Arvada, CO. If requested by
25 USACE, a second laboratory (chosen by USACE) will be used to analyze triplicate samples.

26

27 Sampling of the monitoring wells at FWDA involves a variety of purging and sampling
28 methods. Use of a low-flow pump (described in Section 4.2.2) is the preferred method at
29 FWDA and the NMED guidance document on low-flow sampling should be referenced when
30 groundwater sampling is being conducted (NMED-HWB, 2001). However, due to low yield,

Interim Measures Facility-Wide

Groundwater Monitoring Plan

Fort Wingate Depot Activity

1 some wells require one of the alternative methods described in Section 4.2.4. All water
2 generated during purging activities, as well as the excess groundwater from sampling, will be
3 collected in 5-gallon buckets or equivalent and managed as IDW following procedures
4 described in Section 4.5.

5
6 Table 2-1 contains well construction data, including, top-of-casing and ground surface
7 elevation data for calculation of well volumes. Monitoring wells that do not contain water are
8 identified as dry.

9 10 **4.2.1 Preliminary Site Activities**

11 **4.2.1.1 Initial Inspection**

12 Upon arrival at each monitoring well, the wellhead and exposed casing will be inspected for
13 evidence of tampering or other damage. Observations will be recorded in the field logbook,
14 and the USACE Contracting Officer's Representative (COR) will be notified of any
15 vandalism or damage. Once initial inspection is complete, preventative measures will be
16 employed at the site to reduce risk of contamination. Plastic sheeting or other materials such
17 as absorbent pads will be placed around each wellhead to prevent contamination of sampling
18 equipment and/or ground surface. A staging area will be designated for equipment
19 decontamination to include cleaning solutions, brushes, 5-gallon buckets, and plastic sheeting
20 or absorbent pad, as appropriate.

21 22 **4.2.1.2 Measure Initial Water Level and Calculate Well Volume**

23 Prior to purging and sampling, the depth to groundwater shall be measured from the top-of-
24 casing reference notch and recorded to the nearest 0.01 foot by following the procedure
25 described in Section 4.1. The well volume will be calculated using the measured groundwater
26 level and casing dimensions in the following formula:

$$\begin{aligned} & [\pi \times (\text{filter pack radius (inches)})^2 \times \text{height of filter pack (inches)}] + \\ & [\pi \times (\text{well casing radius (inches)})^2 \times (\text{height of water in casing above annual seal (inches)})] = \\ & \text{well volume (inches}^3\text{)} \times 0.0043 = \text{well volume (gallons)} \end{aligned}$$

27
28
29
30
31
32 Groundwater elevation and well volume calculations will be recorded in the field logbook
33 and/or on the Low-Flow Sampling Data Form (Appendix E) as appropriate.

1 **4.2.2 Low-Flow Pump Purging**

2 Two types of dedicated, adjustable rate, low-flow pumps constructed of stainless steel and/or
3 Teflon[®] and polyethylene are installed in select wells as listed in Table 4-1. Sampling
4 methods for these pumps, identified as either traditional low-flow pumps or Zone Isolation
5 Sampling System (ZIST) low-flow pumping systems, are described in the following sections.
6 Refer to Table 4-2 for the list of required field equipment.

7
8 In a traditional low-flow pump, the pump intake is located approximately 2 feet from the
9 bottom of the screened interval to ensure collection of formation water and to minimize
10 mobilization of particulates present in the bottom of the well.

11
12 The ZIST pumping system is used in wells that cannot be purged by the traditional low-flow
13 technique due to extremely low recharge rates. The system utilizes a low-flow pump and
14 mechanical packers, which isolate the screened interval to ensure the sampling of formation
15 water only. Below the mechanical packer assembly is a solid 1.5-inch-diameter cylinder
16 extending the length of the screened interval that reduces the volume of required purge water.
17 Pumping rates at each well having a ZIST assembly will be determined prior to the sampling
18 event to ensure that the pumping rate does not cause drawdown of the water column.

19
20 Because the low-flow pumps are dedicated (traditional and ZIST) and will remain in place
21 between sampling events, approximately 1 liter of water (or more, depending on pump
22 installation depth/length of discharge tubing and volume of water contained in tubing) will be
23 purged to clear any stagnant water from the pump and discharge tubing.

24
25 **4.2.2.1 Traditional Low-Flow Pump**

26 Drawdown and final pump cycle setting information from previous sampling event(s)
27 (Appendix C) will be checked for each well. The extraction rate of the previous sampling
28 event(s) will be duplicated to the extent practical. The following steps will be performed for
29 purging with traditional low-flow pumps.

- 30 1) Start pump at the lowest speed setting and slowly increase until discharge occurs.
- 31 2) Measure the water level again.
- 32 3) Adjust pump speed until there is little or no water level drawdown. Once water
33 quality readings are stabilized (step nine), the established water level drawdown must
34 not be more than 4 inches/0.33 feet.

- 1 4) Begin purging well to previously determine volume.
- 2 5) Monitor and record water level, purge volume, and purging rate approximately every
3 2 to 5 minutes during purging.
- 4 6) Make any necessary adjustments to pumping rates within the first 15 minutes of
5 purging. Reduce pumping rates as needed to the minimum capabilities of the pump
6 (for example, 30 to 400 milliliters per minute with at least 40 milliliters per pump
7 cycle) to ensure stabilization of indicator parameters. Keep the water level above the
8 well screen. If the static water level is above the well screen, avoid lowering the water
9 level into the screen if possible.
- 10 7) Record all adjustments to pumping rate (both time and flow rate).
- 11 8) During well purging, monitor the following field parameters and record
12 (approximately every 2 to 5 minutes) on the Low-Flow Sampling Data Form
13 (Appendix E).
- 14 – Turbidity
15 – Temperature
16 – Specific conductivity
17 – Hydrogen ion activity (pH)
18 – Dissolved oxygen
19 – Oxygen reduction potential
- 20 9) Purging is considered complete and sampling will begin when the field parameters
21 have stabilized (or if stabilization has not occurred after 30 minutes of purging).
22 Stabilization has occurred when three consecutive readings are within the following
23 limits:

| Parameter | Units | Stabilization Criteria |
|----------------------------|-------|---|
| Temperature | °C | ± 10% |
| pH | SU | ± 0.5 |
| Specific Conductivity | mS/cm | ± 10% |
| Dissolved Oxygen | mg/L | 10% (dissolved oxygen levels less than 1.0 mg/L fall within the margin of error limits) |
| Turbidity | NTU | ± 10% for values greater than 1 NTU |
| Oxygen reduction potential | mV | ± 10 mV |

| Parameter | Units | Stabilization Criteria |
|-------------|-------|---------------------------------------|
| Water Level | feet | 0 to 0.33 foot drawdown (or 4 inches) |

1 °C = degrees Celsius
2 mg/L = milligram per liter
3 mS/cm = millisemen per centimeter
4 mV = millivolts
5 NTU = Nephelometric Turbidity Unit
6 SU = Standard Unit
7

8 All measurements, except turbidity, will be obtained using a transparent flow-through cell
9 that prevents air bubble entrapment in the cell. Field personnel will watch for particulate
10 build-up within the cell, which may affect the transient field parameter values. This build-up
11 may affect field parameter values measured within the cell, and may also cause an
12 underestimation of turbidity values. If the cell needs to be cleaned during purging operations,
13 pumping will continue, and the cell will be disconnected and rinsed with deionized water to
14 remove sediment. The flow-through cell will then be reconnected and monitoring activities
15 will continue. Water should not be allowed to drain out of the flow-through cell when the
16 pump is turned off or cycling on/off. Field personnel will ensure that the monitoring probes
17 remain submerged in water at all times with the exception of the time spent cleaning
18 particulate build-up in the flow-through cell.
19

20 **4.2.2.2 ZIST Low-Flow Pump**

21 Extraction rates from the initial pump setup are located on sample collection logs from
22 previous sampling events and will be duplicated to the extent practical. The following steps
23 will be performed for purging with ZIST low-flow pumps.

- 24 1) Start the pump at the predetermined extraction rate and allow to purge until discharge
25 occurs.
- 26 2) Measure water level during the purging process to ensure that drawdown of the water
27 column does not occur. If drawdown occurs, this will indicate that the mechanical
28 packer system has failed and the ZIST will need to be removed, inspected, and
29 repaired before continuing.
- 30 3) Begin purging well to previously determine volume.
- 31 4) Monitor and record water level and purging rate approximately every 2 to 5 minutes
32 during purging.

- 1 5) During well purging, monitor the following field parameters as described in Section
2 4.2.2.1 and record (approximately every 2 to 5 minutes) on the Low-Flow Sampling
3 Data Form (Appendix E).

4 **4.2.3 Groundwater Sample Collection by Low-Flow Pump**

5 Following stabilization of field parameters, groundwater samples will be collected according
6 to the steps listed below. Sample collection will follow a constituent sampling order
7 determined prior to initiating field activities, and sample bottles for VOC and SVOC analyses
8 will be filled first.

- 9 1) During sampling activities, maintain the pump at approximately the same flow rate
10 during purging and stabilization of field parameters.
- 11 2) Monitor depth-to-water to ensure that the water level does not drop more than
12 0.33 feet from the established pumping level.
- 13 3) Disconnect the flow-through cell.
- 14 4) Field personnel handling sample bottles will wear disposable latex or nitrile gloves.
- 15 5) Collect samples directly from the pump discharge tubing (not from the flow cell
16 discharge tubing) by allowing the discharge to flow gently down the inside of the
17 sample container in order to minimize turbulence.
- 18 6) The discharge tubing will remain filled with water during sampling to minimize
19 possible changes in water chemistry caused by contact with the atmosphere. If the
20 discharge tubing is not completely filled, a clamp or connector (Teflon® or stainless
21 steel) will be added to constrict the sampling end of the tubing, or the flow rate will
22 be increased slightly until the water completely fills the tubing. Small-diameter tubing
23 for the groundwater discharge line will be used to help ensure discharge tubing
24 remains filled with liquid when operating at very low pumping rates.
- 25 7) Fill sample containers in the predetermined order listed in Section 4.2, with
26 containers for VOC and SVOC analyses filled first.
- 27 8) To collect groundwater samples for dissolved metals analysis, place a 0.45-micron
28 filter on the pump discharge tube and allow 100 mL of sample water to flow through
29 the filter as a pre-rinse. After pre-rinsing, fill a specified preserved sample container
30 with the filtered groundwater.

- 1 9) For collecting the groundwater sample for perchlorate, use a pre-rinsed 0.40-micron
2 filter to fill a sterile, non-preserved container. Next, run 100 mL of filtered sample
3 water through a 0.20-micron filter as a pre-rinse for the 0.20-micron filter. After the
4 pre-rinse, fill the perchlorate container with the twice-filtered sample water. This step
5 may need to be repeated as necessary in order to fill the perchlorate sample container.
- 6 10) After filling each sample container, immediately seal, label, and place container into
7 an iced cooler according to the sample management procedures discussed in Section
8 4.3.
- 9 11) Decontaminate the pump after completion of sampling at each monitoring well as
10 described in Section 4.4.
- 11 12) Manage all liquid and solid IDW as described in Section 4.5.

12 **4.2.4 Alternative Groundwater Purging and Sampling Procedures**

13 Some wells at FWDA require alternative methods of purging and sampling due to extremely
14 low yield/low water level. For these wells, purging and sampling are performed with one of
15 the following: disposable bailers, a 12-volt-battery pump, or a dedicated Bennett pump. The
16 methods and type of equipment required for purging and sampling are identified for each
17 well in Table 4-1 and will be recorded on the individual sample log for each well.

18
19 These procedures emphasize the need to remove a sufficient volume of water from each well
20 to ensure that the sampled groundwater is representative of the surrounding formation.
21 Removal of a quantity of water equal to three times the calculated volume of standing water
22 in the well (including the saturated annulus) will be completed wherever possible. See
23 Section 4.2 for calculation of well volume.

24
25 Field parameters will be monitored at a time interval determined by the purge rate, and
26 values will be recorded on the sample collection form (Appendix E). Stabilization of field
27 parameters is used to indicate that conditions are suitable for sampling to begin. Purging is
28 considered complete and sampling will occur under one of the three following scenarios:

- 29
30 • Before three well volumes have been evacuated, three consecutive readings of the
31 field parameters are recorded within the limits listed in Section 4.2.2.1, thus
32 indicating that stabilization has occurred. Discontinue purging and, if the recovery
33 rate is rapid, allow the monitoring well to recover to its original volume prior to
34 sample collection.

- 1 • After evacuation of three well volumes and if the field parameters have not stabilized,
2 discontinue purging, collect samples, and provide a full explanation of attempts to
3 achieve stabilization.
4
- 5 • The monitoring well is emptied before three well volumes can be evacuated due to
6 very slow recovery. Ensure that a minimum of three field parameter readings have
7 been collected. Obtain groundwater samples as soon as the monitoring well has
8 recharged to sufficient volume, which typically occurs the following day. It may take
9 several days to collect the full suite of parameters.

10 11 **4.2.4.1 Disposable Bailers**

12 The following steps describe purging and collecting groundwater samples with disposable
13 bailers.

- 14 1) Securely attach nylon cord to the bailer, carefully lower the bailer into the monitoring
15 well, and allow bailer to fill with groundwater.
- 16 2) Raise bailer out of the monitoring well and empty purge water into a 5-gallon bucket
17 designated for IDW.
- 18 3) Repeat process until the calculated volume of groundwater has been purged from the
19 monitoring well (3 times the well volume).
- 20 4) Discard the bailer used for purging and prepare a new bailer for sample collection.
- 21 5) Collect samples with the disposable bailer in the same manner as purging. Allow the
22 groundwater discharge to flow gently from the bailer down the inside of the sample
23 container via the sampling port at the bottom of the bailer to minimize turbulence.
- 24 6) Fill sample containers in the predetermined order listed in Section 4.2 with containers
25 for VOC and SVOC analyses filled first.
- 26 7) To collect bailed groundwater samples for dissolved metals and/or perchlorates
27 analysis, filter sample with a pre-rinsed 0.45-micron filter using the peristaltic pump
28 and dedicated tubing into a specified preserved sample container (pre-rinsed with at
29 least 100 mL of sample water).
- 30 8) After filling each sample container, immediately seal, label, and place container into
31 an iced cooler according to the sample management procedures discussed in
32 Section 4.3.

- 1 9) All disposable materials, including disposable bailers used for sampling and the
2 collected purge water, will be managed as IDW as described in Section 4.5.

3 **4.2.4.2 Grundfos Redi-Flo2 Pump**

4 A Grundfos Redi-Flo2 submersible pump, or equivalent, will be used in monitoring wells
5 where no dedicated pump is present and sufficient water is available to maintain a water level
6 above the head capacity. The Grundfos pump will also be used to purge wells where
7 sufficient water is available but recharge is poor (i.e., pump dry). Procedures for purging and
8 collection groundwater samples with a Grundfos are as follows:

- 9 1) Attach clean unused polyethylene tubing to the top of the decontaminated
10 Grundfos pump and secure the tubing with an appropriately sized hose clamp.
- 11 2) Lower the Grundfos pump into the well and take care not to agitate the water
12 column. Attach nylon ties every 10 feet around the hose and lead line.
- 13 3) Very carefully touch the well bottom with the pump. Based on the well completion
14 information, slowly raise the pump to just above the bottom of the screened
15 interval.
- 16 4) Secure the tubing and lead line to the well head using nylon ties or equivalent,
17 attach the discharge line to the flow-through cell, and complete the circuit from the
18 control box to the portable generator.
- 19 5) Energize the control box and begin the purge. Water will start to flow up the
20 tubing at about 250HZ for a 65-foot well.
- 21 6) Establish a consistent flow rate of between 1 to 2 gallons per minute using a stop
22 watch and a graduated cylinder. Discharge the calculated volume of purge water
23 into 5-gallon bucket(s), as appropriate.
- 24 7) During well purging, monitor and record the transient field parameters as
25 described in Section 4.2.2.1 (once per well volume evacuated from well). Also
26 document whether a static water level can be achieved from well recharge, or if the
27 purge will completely evacuate the well volume.
- 28 8) When purging is complete, remove the flow-through cell to collect groundwater
29 sample directly from the pump discharge tube. Allow the groundwater to flow
30 gently from the discharge tube down the inside of the sample container to
31 minimize turbulence. If the well has been purged dry, allow for recharge and
32 collect samples via a disposable bailer (see Section 4.2.4.1 for sample procedures).

- 1 9) Fill sample containers in the predetermined order listed in Section 4.2 with
2 containers for VOC and SVOC analyses filled first.

- 3 10) To collect groundwater samples for dissolved metals analysis, place a 0.45-micron
4 filter on the pump discharge tube and fill a specified preserved sample container
5 with the filtered groundwater. Allow for 100 mL of groundwater to flow through
6 the filter as a pre-rinse prior to sample collection.

- 7 11) For collecting the groundwater sample for perchlorate, use a pre-rinsed
8 0.40-micron filter to fill a sterile, non-preserved container. Next, run 100 mL of
9 filtered sample water through a 0.20-micron filter as a pre-rinse for the
10 0.20-micron filter. After the pre-rinse, fill the perchlorate container with the twice-
11 filtered sample water. This step may need to be repeated as necessary in order to
12 fill the perchlorate sample container.

- 13 12) After filling each sample container, immediately seal, label, and place container
14 into an iced cooler according to the sample management procedures discussed in
15 Section 4.3.

- 16 13) Decontaminate the pump after completion of sampling at each monitoring well as
17 described in Section 4.4.

- 18 14) Remove and dispose of the polyethylene tubing after completion of
19 sampling/purging at each monitoring well. Manage all liquid and solid IDW as
20 described in Section 4.5.

21 **4.2.4.3 Bennett Sample Pump**

22 Dedicated Bennett sample pumps are used in cases where the depth to water in a monitoring
23 well is too deep to use disposable bailers. The Bennett pump system consists of a piston
24 activated with pressurized nitrogen gas through a Teflon[®] tube, a second Teflon[®] tube that
25 returns groundwater to the surface, and a third Teflon[®] tube for gas exhaust. Monitoring
26 wells at FWDA equipped with Bennett pumps are identified in Table 4-1. The Bennett pump
27 intake was placed approximately 2 feet from the bottom of the monitoring well. Procedures
28 for using a Bennett pump to purge and collect groundwater samples are as follows:

- 29 1) Connect the air intake tubing from the dedicated pump to the pressurized nitrogen
30 cylinder. Connect the discharge tubing to the flow-through cell.

- 31 2) Turn on gas flow from the nitrogen cylinder. Use initial pumping rate of
32 approximately 4 gpm. For the last 15 to 20 feet of the water column, reduce pumping

- 1 rate to approximately 1 gpm. Discharge the calculated volume of purge water into a
2 5-gallon bucket(s) or tank, as appropriate.
- 3 3) Monitor and record all adjustments to pumping rate.
- 4 4) During well purging, monitor and record the transient field parameters as described in
5 Section 4.2.2.1 (approximately every 2 to 5 minutes).
- 6 5) When purging is complete, remove the flow-through cell to collect samples from the
7 discharge tubing. Allow the groundwater to flow gently from the discharge tube down
8 the inside of the sample container to minimize turbulence.
- 9 6) Fill sample containers in the predetermined order listed in Section 4.2 with containers
10 for VOC and SVOC analyses filled first.
- 11 7) To collect groundwater samples for dissolved metals analysis, place a 0.45-micron
12 filter on the pump discharge tube and allow 100 mL of sample water to flow through
13 the filter as a pre-rinse. After pre-rinsing, fill a specified preserved sample container
14 with the filtered groundwater.
- 15 8) For collecting the groundwater sample for perchlorate, use a pre-rinsed 0.40-micron
16 filter to fill a sterile, non-preserved container. Next, run 100 mL of filtered sample
17 water through a 0.20-micron filter as a pre-rinse for the 0.20-micron filter. After the
18 pre-rinse, fill the perchlorate container with the twice-filtered sample water. This step
19 may need to be repeated as necessary in order to fill the perchlorate sample container.
- 20 9) After filling each sample container, immediately seal, label, and place container into
21 an iced cooler according to the sample management procedures discussed in
22 Section 4.3.
- 23 10) Manage all liquid and solid IDW as described in Section 4.5.

24 **4.2.5 Post-Sampling Activities**

25 Upon completion of groundwater sampling, the nondedicated sampling equipment will be
26 removed from the well, and the final depth to groundwater will be measured from the top-of-
27 casing reference notch and recorded to the nearest 0.01 foot. Reusable measurement and
28 sampling equipment will be decontaminated prior to leaving the site, and all disposable
29 materials and purge water collected during sampling activities will be removed from the site
30 and treated as IDW following procedures outlined in Section 4.5. The monitoring well will
31 be secured prior to leaving the site.

1 **4.3 Sample Management Procedures**

2 **4.3.1 Sample Identification**

3 Each sample will be assigned a unique sample identification (ID) number. Groundwater
4 samples will be identified by the well number followed by the collection date (mmyyyy)
5 (e.g., TMW07042011 for sample from TMW07 on 20 April 2011). Quality control (QC)
6 samples such as field duplicate and quality assurance (QA) samples (described in Section
7 4.6) will have the same ID number as the parent sample and followed by DUP (i.e.,
8 duplicate), triplicate (TRP), matrix spike (MS), or matrix spike duplicate (MSD), as
9 appropriate. Equipment rinsate blanks and trip blanks will carry the designation EQUXXX
10 and TRIPXXX (XXX representing the sequence number of the sample), respectively. A
11 water blank of the source rinsate water for the equipment rinsate blanks will also be included.
12 A water blank of the decontamination water for each water source used for decontamination
13 will be collected prior to initiating decontamination procedures.
14

15 **4.3.2 Chain-of-Custody Documentation**

16 Chain-of-custody documentation will be completed in the field to document sample
17 collection, possession, and the chain of custody. Data on the forms will include the sample
18 ID, tracking number, date sampled, time sampled, project name, project number, and
19 signatures of those in possession of the sample. A sample is considered to be in a person's
20 custody while either under physical custody or safely secured in a controlled access location.
21 Sample custody can be transferred by signature relinquishment and acceptance. The shipping
22 company waybills or bills of lading are considered part of the custody record between the
23 time of collection and receipt at the analytical laboratory. Chain-of-custody records will
24 accompany the sample until receipt at the analytical laboratory.
25

26 **4.3.3 Packaging and Shipping**

27 All samples will be packed and shipped by overnight air freight to the analytical laboratory
28 by the end of the collection day. Unless otherwise indicated, samples will be treated as
29 nonhazardous environmental samples, shipped in heavy-duty coolers, packed with materials
30 such as bubble wrap, bubble bags, or foam blocks to prevent breakage, and preserved with
31 ice in sealed plastic bags. Custody seals will be affixed to the non-hinged side of the lid of
32 each cooler. The custody seals will be signed and dated by a sample team member. Each
33 shipment will include the appropriate field QC samples. Corresponding chain-of-custody
34 forms will be placed in waterproof bags and taped to the inside of the coolers lids. Sample
35 shipments containing VOC samples will contain at least one trip blank.

1 **4.4 Decontamination**

2 Non-dedicated measurement and sampling equipment such as water-level tapes and
3 submersible pumps will be decontaminated prior to and after each use. Equipment
4 decontamination will follow the methods described below.

5

6 Sampling equipment dedicated for use at specific wells, i.e., Bennett sample pumps, will not
7 require decontamination prior to use. Disposable sampling equipment that is used once and
8 then disposed of will not require decontamination prior to use, provided that it is wrapped in
9 the manufacturer’s packaging or otherwise protected from inadvertent contamination prior to
10 use. Note: A water blank of each water source used for decontamination water will be
11 collected prior to initiating decontamination procedures.

12

13 **4.4.1 Decontamination Materials**

14 **4.4.1.1 Specifications for Decontamination Solutions**

15 Specifications for standard cleaning materials referred to in this section are as follows:

16

- 17 • A standard brand of phosphate-free laboratory detergent, such as Liquinox[®] obtained
18 from a laboratory supply distributor, will be used for decontaminating reusable
19 equipment. Use of any other type of detergent will be documented in the field
20 logbooks and investigative reports.
- 21
- 22 • Deionized water will be used for rinsate and decontamination and may be purchased
23 from local vendors.
- 24
- 25 • Laboratory detergent and deionized water used to clean equipment will not be reused
26 during field decontamination.
- 27
- 28 • Used decontamination liquids will be properly containerized and managed as IDW, as
29 described in Section 4.5.

30 **4.4.1.2 Containers for Decontamination Solutions**

31 Improperly handled cleaning solutions may easily become contaminated. Storage and
32 application containers must be constructed of the proper materials to ensure their integrity.
33 The following are acceptable materials used for containing the specified cleaning solutions:

34

1 • Detergent solution is kept in clean plastic, metal, or glass containers until used; it is
2 poured directly from the container during use.

3

4 • Deionized water is kept in clean tanks, hand-held sprayers, or squeeze bottles.

5

6 **4.4.1.3 Safety Procedures for Decontamination Operations**

7 Some of the materials used to implement the cleaning procedures outlined in this section can
8 be harmful if used improperly. Caution should be exercised by all field personnel and all
9 applicable safety procedures should be followed. At a minimum, the following precautions
10 will be observed in the field during decontamination operations:

11

12 • Safety glasses with splash shields or goggles and latex or nitrile gloves will be worn
13 during all cleaning operations.

14

15 • No eating, smoking, drinking, chewing, or any hand-to-mouth contact shall be
16 permitted during cleaning operations.

17

18 **4.4.2 Decontamination Operations**

19 A decontamination area will be established at Building 34. The basic steps for
20 decontamination are as follows:

21

22 1) If necessary, remove particulate matter or debris using a brush or hand-held sprayer
23 filled with deionized water.

24 2) Scrub the surfaces of the equipment using deionized water and Liquinox[®] solution
25 and a second brush made of inert material.

26 3) Rinse the equipment thoroughly with deionized water.

27 4) Place the equipment on a clean surface and allow to air dry.

28 5) Containerize all decontamination liquids and manage as IDW, as described in
29 Section 4.5.

30 After decontamination operations, equipment will be handled only by personnel wearing
31 clean gloves to prevent re-contamination. The equipment will be moved away from the
32 cleaning area to prevent re-contamination. If the equipment is not to be immediately re-used,
33 it will be covered with plastic sheeting or wrapped in aluminum foil to prevent re-

1 contamination. The area where the equipment is stored prior to re-use will be free of
2 contaminants.

3 **4.5 Waste Management Procedures**

4 As required by federal and state law, liquid IDW samples from the 2008 and 2010
5 groundwater sampling events were submitted to an analytical laboratory to determine
6 hazardous waste characteristics. Results from analytical testing showed that liquid IDW
7 generated during these sampling events was non-hazardous. Therefore, purge water and
8 decontamination water associated with the existing monitoring wells at the FWDA will be
9 managed and disposed of by the procedures described below. These procedures apply only to
10 the monitoring wells and sampling activities included in this Interim Measures Facility-Wide
11 GMP.

12
13 Three types of groundwater IDW may be generated during the groundwater sampling events
14 at FWDA: purge water and excess sample water from monitoring wells, decontamination
15 liquids (non-hazardous soap and water), and solid waste (disposable sampling equipment and
16 personal protective equipment). [The aqueous waste generated during groundwater sample
17 activities will be containerized on-site and characterized using laboratory analytical data.
18 Waste will be classified as either hazardous or non-hazardous using 40 CFR 261 guidelines.
19 If the waste is classified as non-hazardous then the waste will be disposed via the evaporation
20 tanks. If the waste is classified as a hazardous waste then it falls under RCRA regulations
21 and must be managed on-site as such and be properly disposed by a qualified permitted
22 facility. First, the appropriate hazardous waste disposal facility will be contacted. Secondly,
23 a DOT certified hazardous waste transporter will collect the hazardous IDW and ship off site
24 to the disposal facility within 90 days. Shipment volumes will be recorded on waste
25 manifests and confirmation of receipt by the facility will be documented.](#)

26
27 Purge water, decontamination water, and other non-hazardous liquid IDW will be
28 containerized at the sample site in clean buckets and/or tanks with a watertight lid.
29 Depending upon the volumes generated, water from multiple wells may be consolidated into
30 one or more containers. At the end of the sampling day, the filled IDW containers will be
31 emptied into one of two low-density polyethylene-lined evaporation tanks. The evaporation
32 tanks are located at the former Building 542 in Parcel 6.

33
34 All solid waste such as disposable sampling equipment, personal protective equipment, and
35 general refuse shall be placed in plastic trash bags. Small quantities of waste will be disposed
36 of in trash containers (dumpsters) located in the Administration Area at FWDA; large
37 quantities of waste material will be transported off site for disposal as municipal waste.

1 **4.6 Quality Assurance Procedures**

2 **4.6.1 Field Equipment Calibration and Preventative Maintenance**

3 Field instruments will be calibrated, operated, and maintained in accordance with the
4 manufacturer's instructions. Daily, on-site field instrument calibrations will be performed
5 before and during each day's use by trained technicians using certified standards. Instrument
6 calibrations will be recorded in bound logbooks dedicated to calibration data and will include
7 field instrument identification, date of calibration, standards used, and calibration results (as
8 described in Section 4.6.3.1).

9

10 If an individual suspects an equipment malfunction, the meter will be removed from service
11 and tagged so that it is not used inadvertently, and a substitute piece of equipment will be
12 used. Additionally, equipment that fails calibration or becomes inoperable during use will be
13 removed from service and tagged. Such equipment will be repaired and satisfactorily re-
14 calibrated. The results of activities performed using equipment that has failed re-calibration
15 will be evaluated. If the results are adversely affected, the outcome of the evaluation will be
16 documented, and the USACE COR will be notified. Equipment that cannot be repaired will
17 be replaced. Back-up equipment will be available in the field for use in case of a malfunction.

18

19 Preventative maintenance procedures for the field instruments will be carried out in
20 accordance with procedures outlined by the manufacturer's equipment manuals. All records
21 of inspection and maintenance will be dated and documented in the appropriate field
22 logbook. Critical spare parts for field instruments will be included in the sampling kits to
23 minimize downtime. In addition, back-up meters will be available, if needed. Spare parts will
24 be purchased from accepted vendors. Daily inspections of field equipment will be conducted
25 to ensure that equipment is functioning properly. If inspection results indicate that a piece of
26 field equipment is deemed faulty or not useable, replacement equipment will be cleaned,
27 calibrated if necessary, and used in place of the faulty equipment. The faulty equipment will
28 then be shipped back to the vendor for repair.

29

30 **4.6.2 Sample Collection Quality Assurance**

31 Several types of field QC samples will be submitted to the analytical laboratory to assess the
32 quality of the data resulting from the field sampling program. These samples will include
33 field duplicate samples, trip blanks, equipment rinsate blanks, field blanks, and MS and MSD
34 samples.

35

1 Field duplicate samples will be collected at a frequency of one per 10 environmental
2 samples. QA split samples may be completed at the government's discretion to check the
3 contractor's laboratory quality performance. Field equipment rinsate blanks are collected at
4 the beginning of the sample event, once per 20 environmental samples, and/or one at the end
5 of the sample event (minimum of 2 samples per event), on non-dedicated equipment.
6

7 Each shipment that contains samples of aqueous VOC analyses will contain a trip blank. The
8 trip blank will be placed in a cooler containing VOC samples and will stay with the cooler
9 until the cooler is returned to the analytical laboratory. Additional volume will be collected at
10 specified sample locations so that one MS/MSD pair will be submitted to the laboratory for
11 every 20 environmental samples.
12

13 **4.6.3 Documentation Quality Assurance**

14 Field documentation shall consist of one or more job- or area-specific field logbooks, field
15 forms, sample chains of custody, and sample logs/labels. Photographic documentation is not
16 required.
17

18 **4.6.3.1 Logbooks**

19 Site and field logbooks provide a daily handwritten record of all field activities. All logbooks
20 will be permanently bound and have a hard cover. Logbooks will be ruled, or ruled and
21 gridded, with sequentially numbered pages. All entries into field logbooks will be made with
22 indelible ink. Field logbooks are detailed daily records that are kept in real time and are
23 assigned to specific activities, positions, or areas within the site. Separate logbooks shall be
24 used for each sampling and field team.
25

26 Documentation in field notebooks will include the following (as necessary):
27

- 28 • Location
- 29 • Date and time
- 30 • Names of field crew
- 31 • Names of subcontractors
- 32 • Weather conditions during field activity
- 33 • Sample type and sampling method
- 34 • Location of sample
- 35 • Sample ID number
- 36 • Sample description (such as color, odor, clarity)
- 37 • Amount of sample

- 1 • Field measurements
- 2 • Equipment specifications
- 3 • Depth to groundwater
- 4 • Decontamination and health and safety procedures
- 5 • Sampling notes (such as well condition, unexpected maintenance, work stoppage,
- 6 etc.)

7

8 A separate logbook dedicated to calibration records will be maintained to include the
9 following information:

10

- 11 • Calibration results
- 12 • Adverse trends in instrument calibration behavior
- 13 • Field instrument identification, date of calibration, and standards used

14

15 If entries in the field notebooks need to be corrected or changed, corrections will be made by
16 crossing out mistakes with a single line, writing the corrections, and initialing and dating the
17 entry. The use of correction fluid is not permitted. At the conclusion of each day in the field,
18 the sampling team leader will review each page of the logbook for errors and omissions. The
19 sampling team leader will then date and sign each reviewed page.

20

21 **4.6.3.2 Field Data Record Forms**

22 In addition to the field notebooks, various forms are used to document field efforts
23 (Appendix E). These forms ensure that all required data and observations are recorded in a
24 consistent manner. No blank spaces will be left; all non-applicable items will be marked “not
25 applicable” (N/A). Forms that will be used include chain-of-custody forms and well sampling
26 forms (Appendix E).

27

28 **4.6.3.3 Final Evidence File Documentation**

29 All evidential file documentation will be maintained under an internal project file system.
30 The USACE COR will ensure that all project documentation and QA records are properly
31 stored and retrievable.

1 **5. MONITORING AND SAMPLING PROGRAM**

2 **5.1 *Monitoring and Sampling Program***

3 This section of the Interim Measures Facility-Wide GMP discusses the objectives for the
4 groundwater monitoring program, the corresponding DQOs, the rationale for the
5 groundwater monitoring program design, and a summary of the monitoring program for both
6 the OB/OD Area and the Northern Area.

8 **5.2 *Data Quality Objectives***

9 DQOs are qualitative and quantitative statements that clarify the project objectives, specify
10 the most appropriate type of data for the project decisions, determine the most appropriate
11 conditions from which to collect data, and specify tolerable limits on decision errors. DQOs
12 are developed to satisfy the specific project objectives in accordance with applicable USACE
13 specifications and NMED and EPA guidance, and are based on the end uses of data
14 determined through a seven-step process as described in EPA QA/G-4 (EPA, 2006)
15 discussed below. The DQO statements derived from the output of each step of the DQO
16 process shall perform the following:

- 17
- 18 • Clarify the study objective.
- 19
- 20 • Define the most appropriate type of data to collect.
- 21
- 22 • Determine the most appropriate conditions from which to collect data.
- 23
- 24 • Specify acceptance levels of decision errors that will be used as the basis for
- 25 establishing the quantity and quality of data needed to support the decision.
- 26

27 DQOs are management tools used to develop a scientific and resource-effective sampling
28 design. The DQOs assist in identifying the required type, quality, and quantity of data needed
29 to support engineering and scientific evaluations, and withstand scientific and legal scrutiny.
30 The DQO process must be initiated during project planning to produce investigations that
31 result in data having a quantifiable degree of certainty.

1 **5.2.1 Data Quality Objective Process**

2 DQOs are based on the end uses of the data and are determined through a seven-step process
3 as described in EPA QA/G-4 (EPA, 2006).

4 • **Step 1 - State the Problem**

5 The purpose of this step is to clearly define the problem that requires new
6 environmental data so the study focus will be clear and unambiguous.

7 • **Step 2 - Identify the Decision**

8 This step involves the identification of the decision/objective that requires new
9 environmental data. Key activities associated with this step include the following:

- 10 – Identifying the key objective for the current phase or stage of the project
- 11 – Identifying alternative actions that may be taken based on the findings of the field
12 investigation
- 13 – Identifying relationships between this objective and any other current or
14 subsequent objectives

15 • **Step 3 - Identify Inputs to the Decision**

16 The purpose of this step is to identify the information needed to support the objective
17 and specify which inputs require new environmental measurements. Key activities
18 associated with this step include the following:

- 19 – Identifying the informational inputs needed to resolve the objective
- 20 – Identifying sources for each informational input and listing those inputs that are
21 obtained through environmental measurements
- 22 – Defining the basis for establishing contaminant-specific action levels
- 23 – Identifying potential sampling approaches and appropriate analytical methods

24 The outputs that will result from this step include a list of informational inputs needed
25 to make the specified decision and a list of environmental variables or characteristics
26 that will be measured. The outputs from this step are actually the inputs that will be
27 used to support the objective, sometimes referred to as the “decision.”

1 • **Step 4 - Define Boundaries of the Study**

2 This step requires the definition of spatial and temporal aspects of environmental
3 media that the data must represent to support the objective. Key activities associated
4 with this step include the following:

- 5 – Defining the geographic areas of the field investigation
- 6 – Defining each environmental medium of concern
- 7 – Dividing each medium into strata having relatively homogeneous characteristics
- 8 – Defining the scale of decision making (this is the smallest area, volume, or time
9 frame of the medium) in which the scoping team wishes to control decision
10 errors
- 11 – Determining the time frame to which the objective applies
- 12 – Determining when to take samples
- 13 – Identifying practical constraints that may hinder sample collection (reconsider
14 previous steps as necessary)

15 • **Step 5 - Develop a Decision Rule**

16 The purpose of this step is to integrate the output from the previous steps of the DQO
17 process into a statement that defines the conditions that would cause the decision
18 maker to choose among alternative actions. Key activities associated with this step
19 include the following:

- 20 – Specifying the parameter of interest (i.e., mean, median, maximum, or
21 proportion)
- 22 – Specifying the action level for the decision

23 • **Step 6 - Specify Limits on Decision Errors**

24 The purpose of this step is to specify the acceptable decision error limits based on a
25 consideration of the consequences of making an incorrect decision. These limits will
26 be used in the last step of the process.

1 • **Step 7 - Optimize the Design**

2 The purpose of this step is to identify the most resource-effective sampling design
 3 that generates data that satisfy the DQOs specified in the preceding steps. To develop
 4 the optimal design for this study, it may be necessary to work through this step more
 5 than once after revisiting previous steps of the DQO process. Several of the steps in
 6 the DQO process can occur simultaneously; in some situations, the process does not
 7 have to include all steps. For example, when enforcement or compliance monitoring
 8 programs are being developed to comply with existing regulations, many of the steps
 9 may have already been completed. ~~As a general guideline, if a contaminant in a well~~
 10 ~~has not been detected in 2 years (4 consecutive sampling events), it will be~~
 11 ~~recommended that the contaminant be removed from the sampling program for that~~
 12 ~~well (pending NMED approval).~~ As a general guideline, analytes that have not been
 13 detected for four consecutive sampling events for a monitoring well are
 14 recommended to be removed (for that specific parameter) from the sampling if the
 15 following conditions apply: if the specific contaminant is not considered a (COPC) or
 16 shows a decreasing trend at the facility and monitoring well.

17 **5.2.2 Interim Measures Facility-Wide Groundwater Monitoring Data Quality Objectives**

18 The DQO process answers the questions of why this investigation is being conducted and
 19 what decisions are to be supported. In addition, the DQO process ensures that the data
 20 collected will have a quantifiable degree of certainty. In using the seven-step DQO process
 21 outlined in Section 5.2.1, the following DQOs for the sampling and analytical program for
 22 the Interim Measures Facility-Wide GMP were identified and summarized in the table below:
 23

| Objective | Discussion |
|-----------------------|--|
| State the Problem | Monitor constituents exceeding cleanup levels in groundwater during the period before long-term monitoring can begin. |
| Identify the Decision | 1. Identify changes in ambient chemical conditions that affect fate and transport. 2. Evaluate groundwater elevations to determine hydraulic gradients and groundwater flow paths. 3. Monitor temporal changes and detect the movement of COIs from one location to another. |

| Objective | Discussion |
|---------------------------------|--|
| Identify Inputs to the Decision | <ol style="list-style-type: none"> 1. Historical background and current site information 2. Operational history 3. Geologic, hydrologic, and soil data from published sources, previous investigations, and documented field observations 4. Chemical contaminant concentration data in groundwater, including: VOCs, SVOCs, explosives, TPH-GRO and DRO, TAL metals including mercury (dissolved and total), perchlorate, nitrate/nitrite, and pesticides 5. New Mexico Water Quality Control Commission (NMWQCC) standards^a 6. EPA maximum contaminant levels (MCL)^b 7. EPA Regional screening levels (RSL) for tap water^c |
| Define the Study Boundaries | <p>The boundaries of the monitoring area were selected based on review of the historical operational history and uses at the site.</p> <p>The monitoring areas are defined as follows:</p> <ul style="list-style-type: none"> – <u>Northern Area</u>: consists of the Administration and Workshop Areas in the Northern region of FWDA. Wells located in the Northern Area are further divided into alluvial wells and bedrock wells. – <u>OB/OD Area</u>: located within the southwest and western portions of the installation; the OB/OD Area can be separated into two sub-areas based on period of operation (Closed and Current OB/OD Area). |

| Objective | Discussion |
|-----------------------------------|--|
| Develop a Decision Rule | <ol style="list-style-type: none"> 1. If COIs in a given analytical suite are detected at frequencies >15% at concentrations above NMWQCC groundwater quality standards and EPA MCLs, it is recommended that the analytical suite be sampled in that particular well on a semi-annual basis. 2. If COIs in a given suite are detected at frequencies <15% at concentrations above the NMWQCC groundwater quality standards and EPA MCLs, such as SVOCs in the Northern Area, it is recommended that the analytical suite be sampled in that particular well every 2 years. 3. If COIs are detected at frequencies <1% at concentrations below NMWQCC groundwater quality standards and EPA MCLs, such as pesticides, it is recommended that the analytical suite be sampled in that particular well every 5 years. 4. If COIs are detected at a different frequency than historically detected, then a change in sampling frequency will be recommended. Recommendations for less frequent sampling will be made if the analyte is fully characterized. |
| Specify Limits on Decision Errors | <ol style="list-style-type: none"> 1. If sample analytical data show false positive indicators, that is, the presence of COIs in groundwater when truly none are present, this could result in additional investigation when none is required. QC procedures followed in the field and laboratory, as well as the data from QC sample analyses, will minimize the probability of making the decision for additional investigation based on false positive data. 2. A false negative decision error, that is, failing to detect and measure COIs present in groundwater samples, could result in a determination to reduce or eliminate COI analytical suites for the site or well when further investigation is warranted. The sampling plan design and QC procedures employed minimize the probability of making a false negative decision error. The investigation is designed to detect and measure COIs in the most likely exposure pathways. |

| Objective | Discussion |
|---------------------|--|
| Optimize the Design | <p>1. The most recently published versions of NMED and EPA-approved sampling methods will be used to provide definitive-level quantitative analytical data that will meet the applicable or relevant and appropriate requirements specified in the Permit (NMED, 2011).</p> <p>2. Historical data will be used to re-evaluate the constituent groups to be analyzed and the sampling frequencies at each target well for both the OB/OD and Northern Areas in accordance with Section V.A.4 of the Permit (NMED, 2005/2014). If a constituent group has not been detected at a well for four consecutive sampling events, it will be recommended for it to be removed from the sampling program. If a constituent group has not been detected at a well for four consecutive sampling events, it will be recommended for it to be removed from the sampling program if it is not a COPC and has never been detected in the monitoring well.</p> |

2 adopted by NMWQCC.

3 b EPA, 2014, U.S. Environmental Protection Agency Regions 3, 6, and 9 Regional Screening Levels for
4 Chemical Contaminants at Superfund Sites, October. [http://www.epa.gov/reg3hwmd/risk/human/rb-](http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/index.htm)
5 [concentration_table/index.htm](http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/index.htm).

6 c EPA, 2014, U.S. Environmental Protection Agency Regional Screening Level Tapwater Supporting Table,
7 http://www.epa.gov/reg3hwmd/risk/human/rb-concentration_table/index.htm> (November).

8 > = Greater than

9 < = Less than

10 COI = contaminant of interest

11 EPA = U.S. Environmental Protection Agency

12 FWDA = Fort Wingate Depot Activity

13 MCL = Maximum contaminant level

14 NMED = New Mexico Environment Department

15 NMWQCC = New Mexico Water Quality Control Commission

16 OB/OD = Open Burn/Open Detonation

17 QC = quality control

18 RSL = regional screening level

19 SVOC = semivolatile organic compound

20 TAL = Target Analyte List

21 TPH-DRO = total petroleum hydrocarbon as diesel range organics

22 TPH-GRO = total petroleum hydrocarbon as gasoline range organics

23 VOC = volatile organic compound

24
25 In addition, NMED- and EPA-approved sampling methods will be used to provide definitive-
26 level quantitative analytical data that will meet the applicable or relevant and appropriate
27 requirements specified in the Permit. Laboratories performing the sample analyses will
28 follow the most recent version of the Department of Defense (DOD) Environmental Field
29 Sampling Handbook, Rev. 1.0, dated April 2013 and the most recent version of DOD Quality
30 Systems Manual (QSM) (Appendix F) (U.S. Department of Defense, 2010). All laboratory
31 analysis will be performed by independent analytical laboratories that maintain DOD
32 Environmental Laboratory Accreditation Program (ELAP) accreditation. In addition to DOD

1 ELAP accreditation, the laboratory shall hold current accreditation for all appropriate fields-
2 of-testing in the State of New Mexico. This is usually accomplished by the laboratory
3 holding a current National Environmental Laboratory Accreditation Program (NELAP)
4 accreditation for all appropriate fields-of-testing. Documentation of current
5 accreditation/certification for the applicable fields of testing is required prior to laboratory
6 acceptance of samples. Analytical results will be validated in accordance with the most
7 current versions of the DOD QSM and EM 200-1-10 (USACE, 2005).

9 ***5.3 Interim Groundwater Monitoring Analytical Program***

10 FWDA is in an ongoing RCRA assessment and compliance monitoring phase (interim).
11 Currently, sufficient data have been collected to identify COIs based on their magnitude and
12 spatial distribution as well as their association with known waste management activities.
13 These COIs include: explosives, nitrate/nitrite, perchlorate, petroleum hydrocarbons, and a
14 limited list of VOCs and SVOCs. Compounds identified as COI require the most intensive
15 monitoring level because their spatial distribution and transport in groundwater must be
16 known to develop and evaluate appropriate corrective actions. Other detected chemicals
17 require monitoring to better understand their presence in groundwater, but the monitoring
18 program need not be as intensive. Targeting specific wells for sampling and analysis, and/or
19 modifying the sampling for these analytical suites, can optimize the program design.

20
21 Attachment 7 of the Permit (NMED, 2005/2014) provides cleanup levels applicable to the
22 FWDA groundwater monitoring program. Groundwater chemical results are evaluated and
23 compared to these cleanup levels (referred to as regulatory health standards). Therefore, the
24 following documents and regulations are used to determine if the concentration of a
25 particular hazardous constituent exceeds the Permit cleanup level (Appendix G):

- 26
27 • NMWQCC standards of 20.6.2.4103.A and B New Mexico Administrative Code.
- 28
29 • EPA drinking water MCL under Title 40 Code of Federal Regulations Parts 141 and
30 142.
- 31
32 • If both a NMWQCC standard and an EPA MCL have been established for a
33 contaminant, the lower of the two was used as a criterion.
- 34
35 • If no NMWQCC standard or EPA MCL has been established for a particular
36 carcinogenic or noncarcinogenic hazardous constituent, the EPA regional screening
37 level for tap water was used.

- 1
- 2 • Currently, there is no NMWQCC groundwater standard or MCL for perchlorate;
3 however, perchlorate concentrations were compared to the value of 6 µg/L noted in
4 the Permit.

5

6 The current monitoring well network has been designed to evaluate the horizontal and
7 vertical extent of chemical constituents in groundwater, and the transport of chemicals that
8 originate from multiple sources. Not all wells need to be sampled for the same analytical
9 suites because certain wells are located to monitor releases from specific SWMUs, and the
10 density of the well network is such that targeting select wells, rather than all wells, provides
11 sufficient data that meet the objectives of the monitoring program.

12 In accordance with Section V.A.4 of the Permit (NMED, 2005/2014), the annual revision of
13 this Interim Measures Facility-Wide GMP re-evaluates the constituent groups to be analyzed
14 and the sampling frequencies at each target well using historical analytical data. To date,
15 sampling frequency has been semi-annual across the entire site. ~~The Army recommends that
16 the Northern Area wells move to an annual sampling frequency due to the large number of
17 wells in this area that have been nondetect for multiple analytes over four consecutive sample
18 events. Additionally, the low hydraulic conductivity in this area will serve to retard
19 contaminant migration. Adjusting the sample frequency along with targeting select wells for
20 specific sampling analysis are of central importance to maximizing the amount of relevant
21 information (information required to effectively address the temporal and spatial objectives
22 of monitoring program), while minimizing costs. Section 5.3.1 discusses this Interim
23 Measures Facility-Wide GMP sampling rationale, including the specific chemical
24 constituents to be analyzed and the proposed sampling frequency.~~

25

26 **5.3.1 Sampling Program Rationale**

27 Table 5-1 provides summary statistics for detected chemical concentrations in groundwater at
28 the OB/OD Area. In addition, Tables 5-2 and 5-3 list the summary statistics for detected
29 chemical concentrations in groundwater for the alluvial and bedrock aquifers in the Northern
30 Area, respectively. These tables do not include dissolved metals because approved
31 groundwater background levels have not been established for FWDA. Therefore, specific
32 identification of dissolved metals that may represent a COI cannot be determined at this time
33 (anthropogenic vs. naturally occurring). However, dissolved and total metals and mercury
34 will continue to be sampled semi-annually until this evaluation criterion has been completed.

1 Chemicals detected in groundwater can be subdivided into three categories based on criteria
2 as defined in past monitoring plans. While maintaining consistency, the criteria and number
3 of categories may be reevaluated and/or optimized as the data trends and analyses become
4 more evident. In the meantime, the following categories will be used for the purpose of
5 selecting the appropriate well network, analytical suites to monitor, and the sample frequency
6 that meets the objectives of the monitoring program:
7

- 8 • Category 1: Chemicals that are frequently detected (greater than or equal to 15
9 percent) with concentrations exceeding the applicable groundwater standard (Table
10 5-4).
- 11 • Category 2: Chemicals that are infrequently detected (less than 15 percent) with
12 concentrations exceeding the applicable groundwater standard (Table 5-5).
- 13 • Category 3: Chemicals that are infrequently detected (less than 1 percent) with
14 concentrations below the applicable groundwater standard (Table 5-6).
- 15
- 16

17 If analytical suites or specific chemical compounds were not detected for 2 consecutive years
18 in a specific well, then these analytical suites and/or compounds were considered as not
19 being of interest, now or in the future (i.e., the data will have no effect on selection of future
20 corrective actions). Consequently, these analytical suites and/or compounds were eliminated
21 from the original chemical analysis roster presented in the initial Interim Measures Facility-
22 Wide GMP (TerranearPMC, 2008). Based on this evaluation criterion only, this annual
23 revision to the GMP eliminates specific suites from the sampling program for the individual
24 wells listed in Table 5-11. This revision also upholds the previous elimination of the
25 following analytical suites for all wells in both the OB/OD and Northern Areas:
26 dioxins/furans, cyanide, herbicides, polychlorinated biphenyls (PCBs), and white
27 phosphorus.
28

29 *5.3.1.1 Category 1*

30 Table 5-4 lists the Category 1 chemicals, the analytical suite, spatial occurrence, and the
31 frequency of detection. Chemicals classified in Category 1 occur at concentrations exceeding
32 the NMWQCC groundwater standards and/or the EPA MCLs (if present) at a frequency
33 greater than or equal to 15 percent of the total samples collected. Category 1 chemicals
34 identified for the GMP are as follows: RDX, bis(2-ethylhexyl)phthalate, 1,2,-dichloroethane,
35 carbon disulfide, toluene, nitrate, nitrite, TPH-DRO, and perchlorate (Table 5-4). These
36 Category 1 chemicals are recommended to be analyzed on a semi-annual basis.
37

1 All Category 1 chemicals are considered COIs that were previously released from various
2 known sources at FWDA. Continued frequent groundwater monitoring of all VOCs at the
3 OB/OD a may not provide useful data for future corrective action planning (i.e., long-term
4 groundwater monitoring plan); however, because bis(2-ethylhexyl)phthalate, 1,2,-
5 dichloroethane, toluene, and carbon disulfide have frequency of detections greater than 15
6 percent and detections that exceed the applicable regulatory standard (Table 5-4), sampling
7 these chemicals semi-annually is recommended in the OB/OD Area. ~~however, the Army
8 recommends that sampling frequency be reduced to annually for Northern Area wells as
9 discussed in Section 5.3.3.~~

10
11 Total petroleum hydrocarbons (DRO and GRO), which have been historically released from
12 the USTs near Building 6 (SWMU 45) in the Northern Area, were analyzed on a semi-annual
13 basis for the well network associated with SWMU 45 until 2015.

14
15 Modifications to the perchlorate, nitrate/nitrite, and explosives are not proposed in the
16 OB/OD Area at this time. ~~however, the Army recommends that the sampling frequency in
17 the Northern Area wells be reduced to annually from semi-annually.~~

18 19 *5.3.1.2 Category 2*

20 Table 5-5 lists the Category 2 chemicals, the analytical suite, and the spatial occurrence.
21 Chemicals classified in Category 2 occur at concentrations exceeding the NMWQCC
22 groundwater standards and/or the EPA MCLs (if present) at a frequency of less than 15
23 percent of the total samples collected. Category 2 chemicals identified for the Interim
24 Measures Facility-Wide GMP cluster into the following analytical suites: explosives,
25 SVOCs, VOCs, one anion, and one pesticide (Table 5-5). Note: Some analytes are defined as
26 different categories in different areas of FWDA. See Tables 5-4, 5-5, and 5-6 for the specific
27 areas/constituent category assignments.

28
29 Because many SVOCs (except phenol in Northern Area bedrock wells) are grouped within
30 Category 2, it is recommended that the full SVOC analytical suite be sampled every 2 years
31 in select wells within the OB/OD and Northern Areas. Based on the sporadic occurrence of
32 SVOCs, both spatially and temporally, and their relative immobility, changes in
33 concentrations over time are expected to be relatively slow. Sampling every 2 years is
34 adequate for the spatial and temporal characterization of SVOC chemicals if present in
35 groundwater.

1 **5.3.1.3 Category 3**

2 Table 5-6 lists the Category 3 chemicals, the analytical suite, and the spatial occurrence.
3 Chemicals classified in Category 3 occur at concentrations *below* the NMWQCC
4 groundwater standards and/or the EPA MCLs (if present) at a frequency of detection less
5 than 1 percent of the total samples taken and will not require regulatory action. Because these
6 specific chemicals are below screening levels, it is suggested that this table be used to reduce
7 the number of constituents in a given suite in the future long-term monitoring plan (SVOCs,
8 VOCs, and explosives). As previously stated, these chemicals have never exceeded
9 regulatory standards and are detected rarely.

10
11 Some pesticide compounds are classified as Category 3 chemicals, thus pesticides should be
12 sampled for every 5 years in select wells within the OB/OD and Northern Areas, as
13 appropriate. Sampling every 5 years is expected to adequately characterize the spatial and
14 temporal changes of pesticides if present in groundwater. Table 5-7 discusses the chemical
15 properties of some Category 3 chemicals and their respective fate and transport
16 characteristics.

17
18 **5.3.2 OB/OD Area**

19 In 2008, the Interim Measures Facility-Wide GMP proposed a broad chemical analysis roster
20 because a comprehensive data set characterizing groundwater contamination did not exist at
21 that time (i.e., identification of COIs was uncertain). In subsequent years, the chemical roster
22 has been modified because specific compounds in several of these analytical suites, such as
23 cyanide, herbicides, PCBs, white phosphorus, and dioxins/furans, had not been detected for
24 2 consecutive years.

25
26 For 2014, the sampling activities in the OB/OD Area were suspended due to munitions
27 clearance activities. Once sampling clearance is granted, groundwater sampling, collection of
28 parameters, and measuring of groundwater elevations will resume.

29
30 The following roster combines the recommendations from Section 5.3.1 and lists the
31 following analytical suites for select wells (Table 5-8) for the current general characterization
32 of groundwater at the OB/OD Area:

- 33
34
- 35 • Explosives (semi-annually)
 - 36 • Nitrite/nitrate (semi-annually)
 - 37 • Perchlorate (semi-annually)
 - TAL dissolved and total metals (semi-annually)

- 1 • Dissolved and total mercury (semi-annually)
- 2 • TCL VOCs (semi-annually)
- 3 • TCL SVOCs (every 2 years)
- 4 • Pesticides (every 5 years)

5
6 Groundwater samples will be collected from select wells in and around the OB/OD unit
7 (closed and current). The targeted wells, sampling frequencies, and analytical suites are
8 shown in Table 5-8. All remaining installed wells (plus any new wells if any are installed)
9 will be sampled semi-annually for explosives, nitrate, nitrite, perchlorate, dissolved TAL
10 metals and mercury, total TAL metals and mercury, TCL VOCs, TCL SVOCs, and pesticides
11 for a minimum of four consecutive sampling events. If a parameter is not detected in a well
12 after four consecutive sampling events, it will be recommended to be removed from the
13 sampling schedule for that specific well **if the specific contaminant is not considered a**
14 **constituent of potential concern at the facility and/or has never been detected in a monitoring**
15 **well**. Field duplicate and field triplicate (if applicable) samples will be collected as
16 summarized in Table 5-9. Additionally, quarterly water level data (site access permitting) and
17 semi-annual water quality parameters (including dissolved oxygen, pH, specific conductance,
18 turbidity, oxidation reduction potential, and temperature) will be collected and recorded as
19 described in Sections 4.1 and 4.2.

20 21 **5.3.3 Northern Area**

22 In 2008, the Interim Measures Facility-Wide GMP proposed a broad chemical analysis roster
23 because a comprehensive data set characterizing groundwater contamination did not exist at
24 that time (i.e., identification of COIs was uncertain). In subsequent years, the chemical roster
25 has been modified because specific compounds, such as herbicides, had not been detected for
26 2 consecutive years or, in the case of dioxins/furans, statistical evaluation indicated the
27 parameter was not a COI.

28
29 The Army recommends that wells sampled semi-annually in the Northern Area be reduced to
30 an annual sampling frequency. The low hydraulic conductivity in this area of FWDA will
31 serve to retard contaminant migration. Furthermore, Table 5-8 demonstrates a large number
32 of wells in the Northern Area are nondetect for one or more analytes over four consecutive
33 sampling events.

34
35 ~~Although it is requested that northern area wells be sampled annually, semi-annual sampling~~
36 ~~will continue until this request is approved by NMED.~~ Select wells will be tested for the
37 following analytical suites (Table 5-8) for the current general characterization of
38 groundwater at the Northern Area:

- 1
- 2 • Explosives (semi-annually)
- 3 • Nitrite/nitrate (semi-annually)
- 4 • Perchlorate (semi-annually)
- 5 • TAL dissolved and total metals (semi-annually)
- 6 • Dissolved and total mercury (semi-annually)
- 7 • TCL VOCs (semi-annually)
- 8 • TCL SVOCs (every 2 years)
- 9 • Pesticides (every 5 years)
- 10 • TPH-GRO and -DRO (associated with SWMU 45 only in alluvium)
- 11

12 Alluvial and bedrock groundwater samples will be collected from select wells in the
13 Northern Area. The targeted wells, sampling frequencies, and analytical suites are shown in
14 Table 5-8. Field duplicate and field triplicate (if applicable) samples will be collected as
15 summarized in Table 5-10. All recently installed wells are sampled semi-annually for
16 explosives, nitrate, nitrite, perchlorate, dissolved TAL metals and mercury, total TAL metals
17 and mercury, TCL VOCs, TCL SVOCs, pesticides, and TPH-GRO and TPH-DRO (wells
18 associated with SWMU 45) for a minimum of four consecutive sampling events, ~~although it~~
19 ~~is recommended that for future sampling events that new wells be sampled annually. If a~~
20 ~~parameter is not detected in a well after four consecutive sampling events, it will be~~
21 ~~recommended to be removed from the sampling schedule for that specific well. If a~~
22 ~~parameter is not detected in a well after four consecutive sampling events, it will be~~
23 ~~recommended to be removed from the sampling schedule for that specific well if the specific~~
24 ~~contaminant is not considered a constituent of potential concern at the facility and/or has~~
25 ~~never been detected in a monitoring well. A parameter that has been detected historically~~
26 ~~may also be removed from the sampling program after being undetected for four consecutive~~
27 ~~sampling events if the extent of contamination has been adequately characterized. Approval~~
28 ~~from the state will be obtained before implementing any recommendations. Additionally,~~
29 quarterly water level data (site access permitting) and semi-annual water quality parameters
30 (including dissolved oxygen, pH, specific conductance, turbidity, oxidation reduction
31 potential, and temperature) will be collected and recorded as described in Sections 4.1 and
32 4.2.

33
34 The monitoring wells associated with the East Landfill in Parcel 18 (EMW01, EMW02,
35 EMW03, and EMW04) were plugged and abandoned when the landfill was removed in 2014.
36 The monitoring wells have been removed from the sampling program.
37

1 ~~Due to the TNT Leaching beds scheduled for removal in 2015, monitoring wells Wingate 89,~~
2 ~~Wingate 90, Wingate 91, and FW26 will be plugged and abandoned. They will also be~~
3 ~~removed from the sampling program. These activities are subject to NMED approval.~~
4 Monitoring wells Wingate 89, Wingate 90, Wingate 91, and FW26 have been plugged and
5 abandoned because they have been unproductive/dry for several years. These activities have
6 been approved by NMED in a letter dated April 18, 2014. The wells were abandoned in
7 accordance with 19.27.4 New Mexico Administrative Code and in conjunction with the New
8 Mexico Office of the State Engineer. A plugging and abandonment record was filed with the
9 state engineer.

11 **5.4 Data Validation**

12 An independent data validation of the results of all chemical analyses analyzed by the
13 accredited laboratory will be performed using the most recent version of the DOD QSM
14 (U.S. Department of Defense, 2010) (Appendix F) and EM 200-1-10 (USACE, 2005).
15 Laboratories performing sample analyses will hold current NELAP accreditation for all
16 appropriate fields of testing. Laboratories will also meet NMED and EPA standards, as
17 required. Laboratories will submit self-declaration forms along with information related to
18 NELAP accreditation to the USACE COR.

19 **5.4.1 General Data Validation Requirements**

20 Data validation will consist of the following:

- 21
- 22 • Verification that the amount of data requested matches the amount of data received
23 (i.e., completeness check).
- 24
- 25 • Verification of the procedures/methods used.
- 26
- 27 • Verification that documentation/deliverables are complete.
- 28
- 29 • Verification that hard copy and electronic versions of the data are identical.
- 30
- 31 • Verification that the data seem reasonable based on analytical methodologies.
- 32
- 33 • Evaluation and qualification of results based on sample receipt (sample temperature
34 and preservation) and holding-time compliance.
- 35
- 36 • Qualification of results based on method, field, and rinse blank results.
- 37

- 1 • Evaluation and qualification of results based on MS/MSD analyses.
- 2
- 3 • Evaluation and qualification of results based on surrogate recoveries.
- 4
- 5 • Evaluation and qualification of results based on internal standard performance.
- 6
- 7 • Verification that the analytical instrument was calibrated in accordance with required
- 8 instrument and method criteria.
- 9
- 10 • Evaluation and qualification of results based on initial and continuing instrument
- 11 calibration verification check sample analyses, and initial and continuing instrument
- 12 calibration blank results.
- 13
- 14 • Evaluation and qualification of results based on laboratory control sample analyses.
- 15
- 16 • Evaluation and qualification of results based on laboratory and field duplicate
- 17 precision.
- 18
- 19 • Verification that the instrument was properly tuned before sample analyses.
- 20
- 21 • Verification that the analytical sequence included pertinent information required to
- 22 track the analyses of all QA/QC and environmental samples.
- 23

24 Analytical data generated for FWDA shall be subjected to 100 percent Stage 2a validation
25 with 10 percent subjected to Stage 4 validation.

26
27 Data qualifiers shall be used to indicate: (1) blank contamination, (2) sample-analytical
28 anomalies associated with a constituent, (3) analytical results that fall between the DL and
29 the limit of quantitation (LOQ), (4) data qualified because of an exceedance of method-
30 specific holding times, high cooler temperatures, or other significant QA/QC data
31 deficiencies, and (5) data results that exceed the upper calibration curve limit for that
32 constituent and associated analytical instrument.

33
34 A Data Quality Summary Report, that will include a Data Validation Report, will be prepared
35 that will discuss the performance of the laboratory with respect to the factors presented
36 above. As much as possible, data will be presented in tabular form. In addition, the Data
37 Validation Report will evaluate the following:

- 38
- 39 • Actual DLs, limits of detection (LODs) and/or the LOQs, as applicable.

- Adequacy of the detection limit for the intended purpose.
- The possible influence(s) of matrix interferences, dilution factors, unusual shipping conditions, and any variance from the reference analytical methods.
- Usability of the data with respect to the project objectives.
- Attainment of DQO process–derived decision statements with respect to chemical data quality.

An electronic data deliverable will be provided in a Microsoft® Access format compatible with USACE Albuquerque and FWDA Environmental Data Management System (EDMS) standards.

Specific data performance criteria for each matrix, analytical group, and analyte are provided in Sections 5.4.2 through 5.4.7. These data quality indicators include parameters of precision, accuracy and bias, representativeness, comparability, completeness, and sensitivity.

5.4.2 Precision

Precision is the degree to which a set of measurements, obtained under similar conditions, conforms to itself. Precision data indicate the consistency and reproducibility of field sampling and/or analytical processes. Precision is usually expressed as a percent difference or standard deviation, in either absolute or relative terms. Overall project precision is measured by the analysis of field sample/duplicate pairs and MS/MSD pairs. The relative percent difference (RPD) of field duplicates, laboratory duplicates, and matrix spikes will be calculated and evaluated with the following limits:

| Analyte | Field Duplicates | MS RPD | LCS RPD |
|--------------------------------|---|--------|---------|
| Anions | Within 2x for detections, within 3x when one result < reporting limit | ≤ 10% | ≤ 10% |
| Explosives | | ≤ 20% | ≤ 20% |
| Perchlorate | | ≤ 20% | ≤ 20% |
| Pesticides | | ≤ 30% | ≤ 30% |
| Semivolatile Organic Compounds | | ≤ 20% | ≤ 20% |
| Volatile Organic Compounds | | ≤ 20% | ≤ 20% |

5.4.3 Accuracy and Bias

Accuracy is the degree of agreement between a sample result and a reference value. Bias refers to the systematic inaccuracy associated with a measurement process. Analytical accuracy is determined by adding a known concentration of target analyte(s) or surrogate

1 analyte(s) (those with properties that mimic analytes of interest, but unlikely to be found in
 2 environmental samples) to a standard reference material or a laboratory control sample (LCS)
 3 consisting of an analyte-free matrix, and performing the prescribed method on the reference
 4 material or LCS.

5 Bias introduced by the sample matrix is determined by adding a known concentration of
 6 target analyte(s) or surrogate analyte(s) to an aliquot of field sample, referred to as a MS
 7 sample, and performing the prescribed method on the spiked sample aliquot. The percent
 8 recovery of LCSs and MS samples will be evaluated with the following percent limits.

9 **Anions:**

| ANALYTE | % LIMIT |
|--------------|---------|
| Nitrate as N | 88 -111 |
| Nitrite as N | 87 -111 |

10 **Explosives:**

| ANALYTE | % LIMIT |
|----------------------------|---------|
| 1,3,5-Trinitrobenzene | 73-125 |
| 1,3-Dinitrobenzene | 78-120 |
| 2,4,6-Trinitrotoluene | 71-123 |
| 2,4-Dinitrotoluene | 78-120 |
| 2,6-Dinitrotoluene | 77-127 |
| 2-Amino-4,6-dinitrotoluene | 79-120 |

| | |
|----------------------------|--------|
| 2-Nitrotoluene | 70-127 |
| 3,5-Dinitroaniline | 71-117 |
| 3-Nitrotoluene | 73-125 |
| 4-Amino-2,6-dinitrotoluene | 76-125 |
| 4-Nitrotoluene | 71-127 |
| HMX | 65-135 |
| Nitrobenzene | 65-134 |

| | |
|---------------|--------|
| Nitroglycerin | 74-127 |
| PETN | 73-127 |
| Picric acid | 80-120 |
| RDX | 68-130 |
| Tetryl | 64-128 |

11 **Perchlorate:**

| ANALYTE | % LIMIT |
|-------------|---------|
| Perchlorate | 84-119 |

12 **Pesticides:**

| ANALYTE | % LIMIT |
|---------------------|---------|
| Aldrin | 45-134 |
| alpha-BHC | 54-138 |
| beta-BHC | 56-136 |
| delta-BHC | 52-142 |
| gamma-BHC (Lindane) | 59-134 |
| alpha-Chlordane | 60-129 |
| gamma-Chlordane | 56-136 |
| 4,4'-DDD | 56-143 |

| | |
|--------------------|--------|
| 4,4'-DDE | 57-135 |
| 4,4'-DDT | 51-143 |
| Dieldrin | 60-136 |
| Endosulfan I | 62-126 |
| Endosulfan II | 52-135 |
| Endosulfan sulfate | 62-133 |
| Endrin | 60-138 |
| Endrin aldehyde | 51-132 |
| Endrin ketone | 58-134 |

| | |
|--------------------|------------|
| Heptachlor | 54-130 |
| Heptachlor epoxide | 61-133 |
| Hexachlorobenzene | 27.8-136.5 |
| Methoxychlor | 54-145 |
| Toxaphene | 33-134 |

13 **Semivolatile Organic Compounds:**

| ANALYTE | % LIMIT |
|------------------------------|---------|
| 1,2,4-Trichlorobenzene | 29-116 |
| 1,2-Dichlorobenzene | 32-111 |
| 1,2-Diphenylhydrazine | 49-122 |
| 1,3-Dichlorobenzene | 28-110 |
| 1,4-Dichlorobenzene | 29-112 |
| 2,2'-oxybis[1-chloropropane] | 37-130 |
| 2,4,5-Trichlorophenol | 53-123 |
| 2,4,6-Trichlorophenol | 50-125 |
| 2,4-Dichlorophenol | 47-121 |
| 2,4-Dimethylphenol | 31-124 |
| 2,4-Dinitrophenol | 23-143 |
| 2,4-Dinitrotoluene | 57-128 |
| 2,6-Dinitrotoluene | 57-124 |

| | |
|-----------------------------|--------|
| 2-Chloronaphthalene | 40-116 |
| 2-Chlorophenol | 38-117 |
| 2-Methylnaphthalene | 40-121 |
| 2-Methylphenol | 30-117 |
| 3 & 4 Methylphenol | 29-110 |
| 3,3'-Dichlorobenzidine | 27-129 |
| 3-Nitroaniline | 41-128 |
| 4-Chloroaniline | 33-117 |
| 4-Chlorophenyl phenyl ether | 53-121 |
| 4-Nitroaniline | 70-120 |
| 4-Nitrophenol | 59-129 |
| Acenaphthene | 47-122 |
| Acenaphthylene | 41-130 |
| Anthracene | 57-123 |

| | |
|-----------------------------|--------|
| Benzidine | 27-150 |
| Benzo[a]anthracene | 58-125 |
| Benzo[a]pyrene | 54-128 |
| Benzo[b]fluoranthene | 53-131 |
| Benzo[g,h,i]perylene | 50-134 |
| Benzo[k]fluoranthene | 57-129 |
| Benzoic acid | 41-120 |
| Benzyl alcohol | 31-112 |
| Bis(2-chloroethoxy)methane | 48-120 |
| Bis(2-chloroethyl)ether | 43-118 |
| Bis(2-ethylhexyl) phthalate | 55-135 |
| Butyl benzyl phthalate | 53-134 |
| Carbazole | 60-122 |
| Chrysene | 59-123 |

| | |
|-----------------------|--------|
| Dibenz(a,h)anthracene | 51-134 |
| Dibenzofuran | 53-118 |
| Diethyl phthalate | 56-125 |
| Dimethyl phthalate | 45-127 |
| Di-n-butyl phthalate | 59-127 |
| Di-n-octyl phthalate | 51-140 |
| Fluoranthene | 57-128 |
| Fluorene | 52-124 |

| | |
|------------------------|--------|
| Hexachlorobenzene | 53-125 |
| Hexachlorobutadiene | 22-124 |
| Hexachloroethane | 21-115 |
| Indeno[1,2,3-cd]pyrene | 52-134 |
| Isophorone | 42-124 |
| Naphthalene | 40-121 |
| Nitrobenzene | 45-121 |
| N-Nitrosodimethylamine | 56-120 |

| | |
|---------------------------|--------|
| N-Nitrosodi-n-propylamine | 49-119 |
| N-Nitrosodiphenylamine | 51-123 |
| Pentachlorophenol | 35-138 |
| Phenanthrene | 59-120 |
| Phenol | 61-120 |
| Pyrene | 57-126 |

1 Volatile Organic Compounds:

| ANALYTE | % LIMIT |
|-----------------------------|---------|
| 1,1,1,2-Tetrachloroethane | 78 -124 |
| 1,1,1-Trichloroethane | 74 -131 |
| 1,1,2,2-Tetrachloroethane | 71 -121 |
| 1,1,2-Trichloroethane | 80 -119 |

| trans-1,3-Dichloropropene | 73 -127 |
| Trichloroethene | 79 -123 |
| Trichlorofluoromethane | 65 -141 |
| Vinyl chloride | 58 -137 |
| Xylenes, Total | 79 -121 |

2

3 5.4.4 Representativeness

4 Representativeness is a qualitative measure of the degree to which a sampling and analysis
5 program reflects the conditions of a site. Representativeness describes the adequacy of the
6 sample collection process and the analysis process, as determined by sample matrix
7 homogeneity and the consistency with which analytical procedures are performed. Method
8 blanks results will meet acceptance criteria if no analytes are detected $> \frac{1}{2}$ LOQ, $> \frac{1}{10}$ the
9 sample amount, or $> \frac{1}{10}$ the regulatory limit.

10

11 5.4.5 Comparability

12 Comparability is the degree to which separate data sets can be represented as similar. The
13 documentation and use of standardized operating procedures in the field and laboratory will
14 help assure the comparability of measurements. Also, field triplicate samples may be
15 collected if directed by USACE, sent to a different laboratory (to be determined), and results
16 compared to the field results. Data will be considered in disagreement if detections are
17 greater than 2 times each other. If one result is greater than 3 times the reporting limit, the

1 data will be considered in disagreement and if one result is greater than 5 times the detection
2 limit, the data will be considered in disagreement.

3 **5.4.6 Completeness**

4 Completeness is a measure of the amount of valid data collected compared to the expected
5 amount of total data. Overall completeness will be inferred from a records review and
6 documented data validation. Sampling completeness is assessed through an evaluation of the
7 total number of samples proposed for collection compared to the actual number of samples
8 collected and analyzed. Analytical completeness is evaluated by comparing the number of
9 useable data points collected compared to the total number of data points generated for each
10 analyte and sample.

11 **5.4.7 Sensitivity**

12 Sensitivity refers to the ability of an analytical method or instrument to detect target analytes
13 at a specified concentration. The DOD QSM has defined the following terms associated with
14 the analysis and reporting of environmental data:

- 15 • *LOD - The smallest amount or concentration of a substance that must be present in a*
16 *sample in order to be detected at a high level of confidence (99%). At the LOD, the*
17 *false negative rate (Type II error) is 1%. This may also be referred to as the method*
18 *detection limit.*
- 19 • *LOQ - The lowest concentration that produces a quantitative result within specified*
20 *limits of precision and bias. For DOD projects, the LOQ shall be set at or above the*
21 *concentration of the lowest initial calibration standard.*
- 22 • *Reporting Limit - A client-specified lowest concentration value that meets project*
23 *requirements for quantitative data with known precision and bias for a specific*
24 *analyte in a specific matrix.*

25 The following limits will be used to evaluate sensitivity requirements (regulatory screening
26 levels are also provided as reference where the screening type is listed). MCL refers to the
27 EPA MCL (EPA, 2014a), NMWQCC refers to the New Mexico Water Quality Control
28 Commission Standards (NMAC 20.6.2.3103), Tapwater refers to the EPA RSL for Tapwater
29 (EPA, 2014b), and NE indicates a standard has not been established. Standards are listed in
30 µg/L.

31 **Anions (mg/L):**

| ANALYTE | LOQ | LOD | DL | LIMIT | STANDARD |
|----------------|------------|------------|-----------|--------------|-----------------|
| Nitrate as N | 0.500 | 0.100 | 0.0420 | 10,000 | MCL |
| Nitrite as N | 0.500 | 0.100 | 0.0490 | 1,000 | MCL |

4

1 **5.5 Environmental Data Management**

2 Following review and approval, the data will be loaded into the FWDA EDMS database. As
 3 noted in Section 5.4.1, data reporting and electronic data deliverables are compatible with the
 4 FWDA EDMS.

5 **5.6 Decision-Making**

6 The screening levels for data comparison are the most recent NMWQCC or the EPA MCL if
 7 there is no NMWQCC. If there is both an NMWQCC and EPA MCL then the more
 8 conservative value will be used. If no NMWQCC standard or EPA MCL have been
 9 established, data will be compared against the EPA RSL for Tapwater. Note: the most
 10 recently published version of the screening levels must be used. Below are the analytes, the
 11 screening limit, and the screening type. MCL refers to the EPA MCL (EPA, 2014a),
 12 NMWQCC refers to the New Mexico Water Quality Control Commission Standards (NMAC
 13 20.6.2.3103), Tapwater refers to the EPA RSL for Tapwater (EPA, 2014b), and NE indicates
 14 a standard has not been established. Standards are listed in µg/L.

4 **5.7 Data Evaluation**

5 As described in Section 5.3, groundwater data generated during ground water monitoring will
 6 be evaluated with respect to cleanup levels described in Attachment 7 of the Permit (NMED,
 7 2005/2014).

8

9 **5.8 Reporting**

10 Analytical results will be submitted in a semi-annual report prepared in accordance with
 11 NMED guidance entitled *General Reporting Requirements for Routine Groundwater*

- 1 *Monitoring at RCRA Sites* (2003; included in Appendix G). The report will be submitted to
- 2 NMED not more than 60 days subsequent to the receipt of final validated laboratory reports.

1 **6. SCHEDULE**

2 Groundwater elevation data will be collected on a quarterly basis in January, April, July, and
3 October.

4

5 Currently all areas are sampled on a semi-annual basis. ~~The army recommends that~~
6 ~~groundwater samples from the Northern Area of FWDA be collected annually in October of~~
7 ~~each year.~~ Currently, the OB/OD area is restricted due to ongoing munitions clearance
8 activities due to explosive safety regulations. Sampling will resume when this restriction is
9 lifted.

10

11 The first sample collection under this Interim Measures Facility-Wide GMP took place in
12 April 2008 and has continued each April and October throughout 2014 according to the
13 existing GMP.

1 **7. RECOMMENDATIONS**

2 ~~The Army proposes sampling monitoring wells annually in the Northern Area of the~~
 3 ~~installation in 2015.~~

4 From Table 5-8 and Table 5-11, the following monitoring wells have been non-detect for a
 5 particular analyte for four consecutive sampling events as of April 2014, ~~have never had a~~
 6 ~~detection for the analyte group, and/or are not COIs.~~ It is recommended that analyses be
 7 discontinued for the ~~analytes wells~~ listed.

^a Horizontal Coordinate System: NM NAD83 State Plane Central

^b Vertical Coordinate System: NAVD88

^c Indicates the well is used for water level measurements; not sampled.

AR = Air Rotary

bgs = Below ground surface

famsl = Feet above mean sea level

ft = Feet

FWDA = Fort Wingate Depot Activity

HSA = Hollow Stem Auger

ID = Identification

in = Inches

NA = Not applicable

NAD83 = North American Datum of 1983

NAVD88 = North American Vertical Datum of 1988

ND = No data available

NM = New Mexico

PVC = Polyvinyl Chloride

Note: If both an NMWQCC standard and an EPA MCL have been established for a contaminant, the more conservative value will be compared against. If no NMWQCC standard or EPA MCL have been established, the EPA Tapwater standard will be compared against.

^a Table summarizes groundwater data collected at FWDA from April 2008 through April 2014.

^b EPA, 2014. Regions 3, 6, and 9 Regional Screening Levels for Chemical Contaminants at Superfund Sites, updated November.

^c NMWQCC, 2001. 20.6.2.7(ww) New Mexico Administrative Code, Definitions – toxic pollutant.

^d EPA, 2014. Regional Screening Level Tapwater Supporting Table, updated November.

^e For perchlorate, a value of 6 µg/L is used per the FWDA RCRA Permit.

^f With respect to 1,4-dioxane, the USACE considers these detection anomalies. 1,4-Dioxane was only detected during in the October 2008 sampling event. It was not detected in any prior sampling events or any sampling events since that time. These detections appear random with no coherent pattern. 1,4-Dioxane also appeared in samples collected from wells having screens constructed in different hydrogeologic units spread out over the entire property, in the OB/OD Area and the Northern Area. For these reasons, USACE suspects these results as lab contaminants or some other aberration, and 1,4-dioxane will not be considered in the Category 1, 2, or 3 evaluation.

> = Greater than

% = Percent

µg/L = Microgram per liter

EPA = Environmental Protection Agency

FWDA = Fort Wingate Depot Activity

MCL = Maximum Contaminant Level

NE = Not established

NMWQCC = New Mexico Water Quality Control Commission

No. = Number

OB/OD = Open Burn/Open Detonation

RSL = Regional Screening Level

RCRA = Resource Conservation and Recovery Act

Table 5-2
Summary of Detected Analytes in Alluvial Groundwater for Northern Area^a

| Analyte | Sample Analysis | | | | | | Regulatory Standard | | | |
|-----------------|-----------------|-------------|------------------------|---------------------------------------|---------------------------------------|-----------------|-----------------------------|----------------------------|---|---|
| | Total Samples | No. Detects | Frequency of Detection | Minimum Detected Concentration (µg/L) | Maximum Detected Concentration (µg/L) | Arithmetic Mean | EPA MCL ^b (µg/L) | NMWQCC ^c (µg/L) | EPA RSLs for Tapwater ^d (µg/L) | Max. Detect Conc. > Min. Screening Level? |
| TRICHLOROETHENE | 542 | 1 | 0.18% | 1.3 | 1.3 | 1.30 | 5 | 100 | 0.49 | NO |
| VINYL CHLORIDE | 542 | 1 | 0.18% | 3.8 | 3.8 | 3.80 | 2 | 1 | 0.019 | YES |

Note: If both an NMWQCC standard and an EPA MCL have been established for a contaminant, the more conservative value will be compared against. If no NMWQCC standard or EPA MCL have been established, the EPA tapwater standard will be compared against.

^a Table summarizes groundwater data collected at FWDA from April 2008 through April 2014.

^b EPA, 2014. Regions 3, 6, and 9 Regional Screening Levels for Chemical Contaminants at Superfund Sites, updated November.

^c NMWQCC, 2001. 20.6.2.7(ww) New Mexico Administrative Code, Definitions – toxic pollutant.

^d EPA, 2014. Regional Screening Level Tapwater Supporting Table, updated November.

^e For perchlorate, a value of 6 µg/L is used per the FWDA RCRA Permit.

^f Previous work plans have referenced NMED, 2012. Table 6-2. TPH Screening Guidelines for Potable Groundwater (GW-1), Risk Assessment Guidance for Site Investigations and Remediation, Volume I, Tier 1: Soil Screening Guidance Technical Background Document, Hazardous Waste Bureau and the Ground Water Quality Bureau – Voluntary Remediation Program, February 2012. In November 2014 NMED updated this guidance and removed the TPH guidelines for potable water outlined in Table 6-2.

^g With respect to 1,4-dioxane, the USACE considers these detection anomalies. 1,4-Dioxane was only detected during in the October 2008 sampling event. It was not detected in any prior sampling events or any sampling events since that time. These detections appear random with no coherent pattern. 1,4-Dioxane also appeared in samples collected from wells having screens constructed in different hydrogeologic units spread out over the entire property, in the OB/OD Area and the Northern Area. For these reasons, USACE suspects these results as lab contaminants or some other aberration, and 1,4-dioxane will not be considered in the Category 1, 2, or 3 evaluation.

> = Greater than

% = Percent

µg/L = Microgram per liter

EPA = Environmental Protection Agency

FWDA = Fort Wingate Depot Activity

MCL = Maximum Contaminant Level

NE = Not established

NMED = New Mexico Environment Department

NMWQCC = New Mexico Water Quality Control Commission

No. = Number

OB/OD = Open Burn/Open Detonation

RCRA = Resource Conservation and Recovery Act

RSL = Regional Screening Level

TPH = Total petroleum hydrocarbon

| XYLENES | 14 | 2 | 14.29% | 0.25 | 1.3 | 0.78 | 10,000 | 620 | 190 | NO |

Note: If both an NMWQCC standard and an EPA MCL have been established for a contaminant, the more conservative value will be compared against. If no NMWQCC standard or EPA MCL have been established, the EPA tapwater standard will be compared against.

^a Table summarizes groundwater data collected at FWDA from April 2008 through April 2014.

^b EPA, 2014. Regions 3, 6, and 9 Regional Screening Levels for Chemical Contaminants at Superfund Sites, updated November.

^c NMWQCC, 2001. 20.6.2.7(ww) New Mexico Administrative Code, Definitions – toxic pollutant.

^d EPA, 2014. Regional Screening Level Tapwater Supporting Table, updated November.

^e For perchlorate, a value of 6 µg/L is used per the FWDA RCRA Permit.

^f Previous work plans have referenced NMED, 2012. Table 6-2. TPH Screening Guidelines for Potable Groundwater (GW-1), Risk Assessment Guidance for Site Investigations and Remediation, Volume I, Tier 1: Soil Screening Guidance Technical Background Document, Hazardous Waste Bureau and the Ground Water Quality Bureau – Voluntary Remediation Program, February 2012. In November 2014 NMED updated this guidance and removed the TPH guidelines for potable water outlined in Table 6-2.

^g With respect to 1,4-dioxane, the USACE considers these detection anomalies. 1,4-Dioxane was only detected during in the October 2008 sampling event. It was not detected in any prior sampling events or any sampling events since that time. These detections appear random with no coherent pattern. 1,4-Dioxane also appeared in samples collected from wells having screens constructed in different hydrogeologic units spread out over the entire property, in the OB/OD Area and the Northern Area. For these reasons, USACE suspects these results as lab contaminants or some other aberration, and 1,4-dioxane will not be considered in the Category 1, 2 or 3 evaluation.

% = Percent

> = Greater than

DRO = Diesel range organic

EPA = Environmental Protection Agency

FWDA = Fort Wingate Depot Activity

µg/L = Microgram per liter

NE = Not established

NMED = New Mexico Environment Department

NMWQCC = New Mexico Water Quality Control Commission

No. = Number

^a Test Methods for Evaluating Solid Waste, Second Edition, Office of Solid Waste Manual SW-846

Note: Semi-annual sample collection under the Interim Groundwater Monitoring Plan began in April 2008 and has continued each April and October

| | |
|----|---|
| | Indicates that the well has not been sampled for a particular analytical suite since 2012 or earlier. |
| ND | Indicates that no compounds from the analytical group have ever been detected, as shown on Table 5-8. |

EPA = Environmental Protection Agency
1x = Annually
x/2 = Every two years
x/5 = Every five years
FWDA = Fort Wingate Depot Activity
GW = Groundwater
ID = Identification
OB/OD = Open Burn/Open Detonation
Quarterly = Samples/water levels collected in January, April, July, and October
Semi-annually = Samples collected in April and October
SVOC = Semi-volatile Organic Compound
TAL = Target Analyte List
TCL = Target Compound List
TPH-DRO = Total Petroleum Hydrocarbon - Diesel Range Organics
TPH-GRO = Total Petroleum Hydrocarbon - Gasoline Range Organics
VOC = Volatile Organic Compound

**Table 5-9
Analytical Requirements and Sample Summary for OB/OD Area Wells**

| Matrix | Analytical Group | Analytical Method ^a | Container (Number, Size, and Type) | Preservation Requirements | Analytical Holding Time | Number of Samples ^b | Number of Field Duplicates ^c | Number of Field Triplicate (Split) Samples ^d | Number of MS/MSD Samples ^e | Number of Field Blank Samples |
|--------------------------------|------------------------------|--------------------------------|------------------------------------|------------------------------|---|--------------------------------|---|---|---------------------------------------|-------------------------------|
| Water | TCL VOCs | 8260C | (3) - 40 mL VOC glass vials | Cool to ≤6°C; pH <2 with HCl | 14 days to analysis | 14 | 2 | 2 | 1 | TBD |
| Water | TCL SVOCs | 8270D | (1) - 1 L Amber bottle | Cool to ≤6°C | 7 days extraction/40 days analysis | 6 | 1 | 1 | 1 | TBD |
| Water | Explosives | 8330B | (2) - 1 L Amber bottles | Cool to ≤6°C | 7 days to extraction; 40 days from extraction to analysis | 9 | 1 | 1 | 1 | TBD |
| Water | Nitrite | 300.0 | (1) - 500 mL Poly bottle | Cool to ≤6°C | 28 days to analysis | 12 | 2 | 2 | 1 | TBD |
| Water | Perchlorate | 6860 | (1) - 250 mL Poly bottle | Cool to ≤6°C | 28 days | 8 | 1 | 1 | 1 | TBD |
| Water | Pesticides | 8081B | (1) - 1 L Amber bottle | Cool to ≤6°C | 7 days to extraction; 40 days from extraction to analysis | 1 | 1 | 1 | 1 | TBD |
| Water | Nitrate | 300.0 | (1) - 250 mL Poly bottle | Cool to ≤6°C; H2SO4 to pH <2 | 48 hours to analysis | 12 | 2 | 2 | 1 | TBD |
| Water | Total Mercury/TAL Metals | 7470/6010C or 6020A | (1) - 1 L Poly bottle | Cool to ≤6°C; HNO3 to pH <2 | 6 months for TAL metals; 28 days for Mercury | 16 | 2 | 2 | 1 | TBD |
| Water | Dissolved Mercury/TAL Metals | 7470/6010C or 6020A | (1) - 1 L Poly bottle | Cool to ≤6°C; HNO3 to pH <2 | 6 months for TAL metals; 28 days for Mercury | 16 | 2 | 2 | 1 | TBD |
| Total Number of Samples | | | | | | 94 | 14 | 14 | 9 | TBD |

^a *Test Methods for Evaluating Solid Waste*, Second Edition, Office of Solid Waste Manual SW-846. The most recently published methods will be used for analysis.

^b Number of samples represents the samples necessary for one sample event regardless of how frequently each well is to be sampled.

^c One per ten samples

^d One per twenty samples

^e One per cooler with volatile samples

< = Less than

°C = Degree Celsius

H₂SO₄ = Sulfuric acid

HCl = Hydrochloric acid

HNO₃ = Nitric acid

L = Liter

mL = Milliliter

MS = Matrix spike

MSD = Matrix spike duplicate

SVOC = Semivolatile organic compound

TAL = Target Analyte List

TBD = To be decided based per sampling event

TCL = Target Compound List

VOC = Volatile organic compound

**Table 5-10
Analytical Requirements and Sample Summary for Northern Area Wells**

| Matrix | Analytical Group | Analytical Method ^a | Container (Number, Size, and Type) | Preservation Requirements | Analytical Holding Time | Number of Samples ^b | Number of Field Duplicates ^c | Number of Field Triplicate (Split) Samples ^c | Number of MS/MSD Samples ^d | Number of Field Blank Samples |
|--------------------------------|------------------------------|--------------------------------|------------------------------------|------------------------------|---|--------------------------------|---|---|---------------------------------------|-------------------------------|
| Water | TCL VOCs | 8260C | (3) - 40 mL VOC glass vials | Cool to ≤6°C; HCl to pH <2 | 14 days to analysis | 36 | 4 | 4 | 2 | TBD |
| Water | TPH-GRO | 8015C | (3) - 40 mL VOC glass vials | Cool to ≤6°C; HCl to pH <2 | 14 days to analysis | 5 | 1 | 1 | 1 | TBD |
| Water | TCL SVOCs | 8270D | (1) - 1 L Amber bottle | Cool to ≤6°C | 7 days extraction/40 days analysis | 34 | 4 | 4 | 2 | TBD |
| Water | Explosives | 8330B | (2) - 1 L Amber bottles | Cool to ≤6°C | 7 days to extraction; 40 days from extraction to analysis | 25 | 3 | 3 | 2 | TBD |
| Water | TPH-DRO | 8015B | (1) - 1 L Amber bottle | Cool to ≤6°C | 7 days to extraction; 40 days from extraction to analysis | 17 | 2 | 2 | 1 | TBD |
| Water | Nitrite | EPA 300.0 | (1) - 500 mL poly bottle | Cool to ≤6°C | 28 days to analysis | 54 | 6 | 6 | 3 | TBD |
| Water | Perchlorate | 6850 | (1) - 250 mL poly bottle | Cool to ≤6°C | 28 days | 46 | 5 | 5 | 3 | TBD |
| Water | Pesticides | 8081B | (1) - 1 L Amber bottle | Cool to ≤6°C | 7 days to extraction; 40 days from extraction to analysis | 6 | 1 | 1 | 1 | TBD |
| Water | Nitrate | EPA 300.0 | (1) - 250 mL poly bottle | Cool to ≤6°C; H2SO4 to pH <2 | 48 hours to analysis | 54 | 6 | 6 | 3 | TBD |
| Water | Total Mercury/TAL Metals | 7470/6010C or 6020A | (1) - 1 L Poly bottle | Cool to ≤6°C; HNO3 to pH <2 | 6 months for TAL metals; 28 days for Mercury | 62 | 7 | 7 | 4 | TBD |
| Water | Dissolved Mercury/TAL Metals | 7470/6010C or 6020A | (1) - 1 L Poly bottle | Cool to ≤6°C; HNO3 to pH <2 | 6 months for TAL metals; 28 days for Mercury | 62 | 7 | 7 | 4 | TBD |
| Total Number of Samples | | | | | | 401 | 46 | 46 | 26 | TBD |

^a *Test Methods for Evaluating Solid Waste*, Second Edition, Office of Solid Waste Manual SW-846. The most recently published methods will be used for analysis.

^b Number of samples is based on the number of samples required for a single sample event, regardless of the sample frequency.

^c One per ten samples

^d One per twenty samples

Note: Number of samples is based on proposed sample frequency.

< = Less than

°C = Degree Celsius

H₂SO₄ = Sulfuric acid.

HCl = Hydrochloric acid

HNO₃ = Nitric acid

L = Liter

mL = Milliliter

MS = Matrix spike

MSD = Matrix spike duplicate

SVOC = Semivolatile organic compound

TAL = Target Analyte List

TBD = To be decided based per sampling event

TCL = Target Compound List

TPH- DRO = Total petroleum hydrocarbon diesel range organic

TPH- GRO = Total petroleum hydrocarbon gasoline range organic

VOC = Volatile organic compound

Table 5-11 Summary of Consecutive Non-detected Analytical Suites
