RE: Revised Letter Work Plan - Soil Testing and Removal at the Former Water Tower and Tank sites at Fort Wingate Depot Activity

Dear Mr. Hendrickson:

On February 27, 2013, a letter work plan (Attachment A) was submitted to describe the approach for obtaining additional soil data and the removal of soil at the Former Water Tower and Tank sites. This work plan was approved by the United States Environmental Protection Agency (US EPA) through an email dated March 4, 2013 (Attachment B). The need for additional investigation was prompted following soil sampling performed after completion of demolition activities. At this time, one sample location indicated a lead concentration of 974 milligrams per kilogram (mg/kg) that exceeded the Residential Soil Screening Level (SSL) value for lead of 400 mg/kg established in the 2012 New Mexico Environmental Department (NMED) *Risk Assessment Guidance for Investigations and Remediation, February 2012 (updated June 2012)*.

The 2013 letter work plan specified the collection of 60 samples on a 15 foot grid at the Former Water Tower and Tank sites and 33 samples on a 25 foot grid to cover the demolition and lay down area located to the north. The samples would be analyzed for cadmium, chromium III, chromium VI, lead, and polychlorinated biphenyls (PCBs). Following a comparison of the soil results to the 2012 NMED SSLs, the 2013 letter work plan specified an approach for removal of the areas, on a grid by grid basis, for those areas exceeding NMED SSLs.

On August 15, 2013, soil sampling was conducted at the Former Water Tower and Tank sites. The soil sample results with concentrations that exceed the 2012 NMED Residential SSLs are presented in Table 1. A summary of all results is provided as Table 2. Numerous sample locations indicated concentrations of lead and chromium VI that exceeded their respective NMED SSLs. Detectable concentrations of the lead and chromium VI are shown on Figure 1. There were no concentrations of PCBs, chromium III or cadmium above their respective NMED SSLs.

The Army was ready to initiate the removal process in August of 2014. The estimated area to be removed, totaling 650 cubic yards, is shown in Figure 2. In preparation for removal, two composite soil samples were collected randomly over the entire impacted area to characterize the soil for disposal purposes. Each sample was analyzed for metals including chromium VI and lead using the Toxicity Characteristic Leaching Procedure (TCLP) method. The results

(Attachment C) revealed that the leachable lead concentration for one of the samples exceeded the TCLP threshold of 5 milligrams per liter (mg/l). As a result, plans for removal activities were postponed pending discussions regarding the best approach for handling the impacted soil.

In late 2014, discussions were held with US EPA regarding the Army's intent to stabilize the soil in place so that upon removal it would not be necessary to handle as hazardous waste. Email correspondence regarding these discussions is included as Attachment D.

The soil stabilization will be completed in place to a depth of six inches (6") below the existing ground surface using ECOBOND stabilization to reduce the lead concentrations to less than 5.0 mg/l using the TCLP method. The stabilization process will be verified by the treatment contractor on the in situ soils. Once it has been determined that the soil is stabilized, the soil will be excavated and stock piled on site for waste characterization profiling. The waste characterization samples will be submitted to a certified laboratory.

Following removal action, confirmation samples will be collected and submitted for analysis of chromium VI and lead. Soil concentrations will be compared to the 2014 NMED SSLs. If results from a sample exceed the 2014 SSL (or additive amount) for any of the constituents tested, then a square box eight feet (or 12 feet in the demolition area) on every side of the exceedance will be removed to a depth of 0.5' below the surface. The alignment of the 16' x 16' (or 24' x 24') box will be based on the grid layout. This removal area represents the distance half way to the nearest 'clean' sample point. If an exceedance occurs on the edge of the grid, then the eight (or 12) foot distance will go beyond the grid. Once the soil is removed another sample will be taken at the original location and tested for the parameter(s) that exceed the SSL. If there is another exceedance, then another 0.5' will be removed and another test obtained. Sampling and removal will cease when sample results are below the SSLs.

The reporting for this project will be included as a Supplemental Investigation Report to the Parcel 13 RFI report. The Army plans to conduct the removal action in June of 2015 and therefore is requesting a quick review if possible. If you have questions or require further information, please call me at 330-358-7312.

Sincerely,

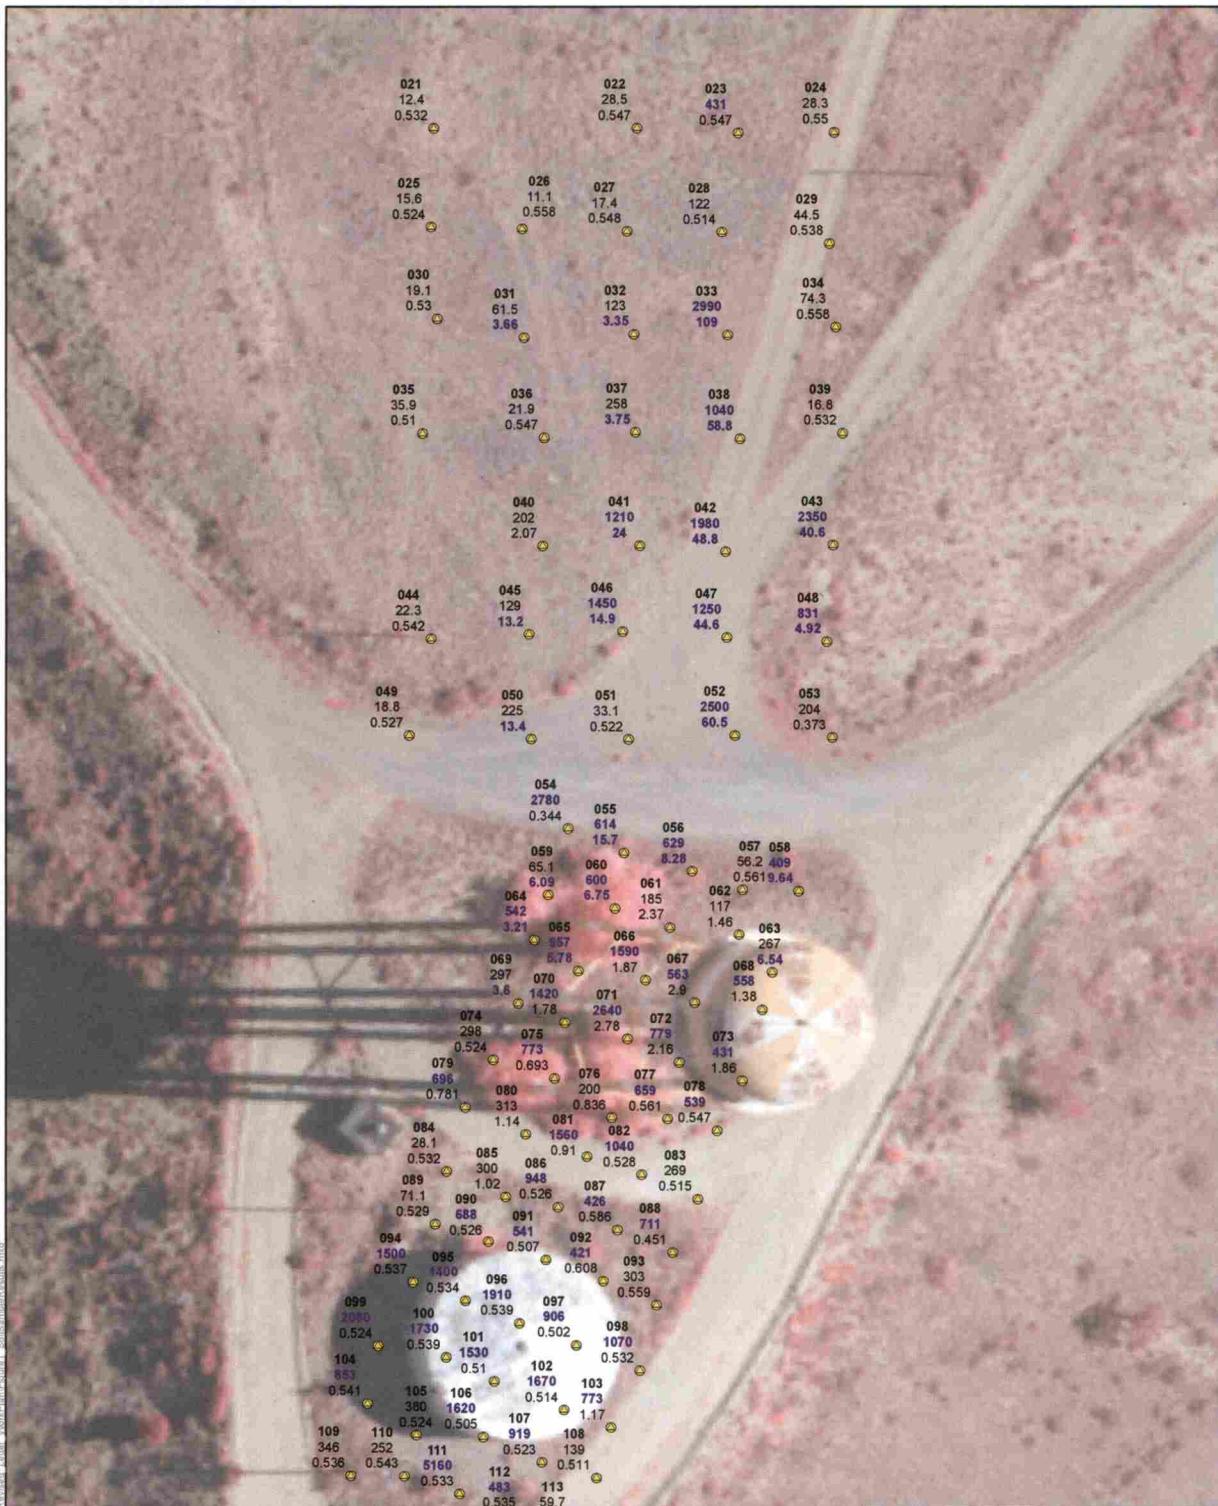

PATTERSON.MARK.

Notes:

Sample ID nomenclature:

Sample ID's consist of a combination of Parcel, AOC, purpose of sample, increment number, sample type, sample depth, and matrix.

Example: 13008ST53SS-030D02-SO

Lab Qualifier Codes:

Organics

J Indic平 that the analyte is positively identified and the result is less than the LOQ/RL but greater than the LOD/MDL.

U Undetected at the Limit of Detection

+ - EPA RSL used as screening level when no NMED SSL exists

J Fort Wingate Depot Activity Site Specific Background for Arsenic (11.2 mg/kg) used in place of 3.9 mg/kg NMEDSSL

NMED December 18, 2013 Letter, Evaluation of Background Levels for Arsenic in Soil, Fort Wingate Depot Activity, New Mexico

Screening level exceedances indicated by red result and a yellow highlighted "YES".

NMED SSL - New Mexico Environmental Department Soil Screening Level, as published in the Risk Assessment Guidance for Site Investigations and Remediation. New Mexico Environmental Department, Hazardous Waste Bureau and Ground Water Quality Bureau Voluntary Remediation Program, June 2012.

EPA RSL - U.S. Environmental Protection Agency Regional Screening Level, as published in the Human Health Medium-Specific Screening Levels 2014. U.S. Environmental Protection Agency, Region 6, May 2014.

Table 2 - RCRA Facility Investigation Sample Results

RE: Letter Work Plan - Soil Testing and Removal at the Former Water Tower and Tank sites at Fort Wingate Depot Activity

Dear Mr. Hendrickson:

The purpose of this letter work plan is to describe the approach for obtaining additional soil data and the removal of soil at the former Water Tower and Tank sites. The water tower and tank were demolished in June 2012 due to safety concerns and potential for lead contamination in preparation for property transfer. The Army sampled the soil in October 2012 to determine if there was a release of lead above the Soil Screening Levels SSLs. Samples under this study will be compared to the residential 2012 New Mexico (NMED) SSLs established as the cleanup levels for Fort Wingate Depot Activity (FWDA). See the table below for the proposed cleanup levels.

Chemical	Residential Soil (mg/kg)
Cadmium	7.03E+01
Chromium III	1.17E+05
Chromium VI	2.97E+00
Lead	4.00E+02
Polychlorinated biphenyls (PCBs)	
Aroclor 1016	3.93E+00
Aroclor 1221	1.49E+00
Aroclor 1232	1.49E+00
Aroclor 1242	2.22E+00
Aroclor 1248	2.22E+00
Aroclor 1254	1.12E+00
Aroclor 1260	2.22E+00

Sampling Technical Approach. Soil sampling performed after completion of demolition activities at this site show a lead level at one location of 974 mg/kg, exceeding the value established in the NMED Soil Screening Levels (SSLs) dated February 2012. See Figure 1. The limit of the disturbed area on Figure 1 represents the area cleared for fire protection which extends beyond the area impacted by demolition operations. This work plan proposes obtaining

samples from an area based on previous sampling results conducted by the Army and input from the USEPA. Soil will be sampled for cadmium, chromium III, chromium VI, lead, and PCBs from 60 locations within a 60'x165' area on a 15 foot grid as shown in blue on Figure 1. The 60'x165' grid will cover the original water tower and tank areas.

To address the impact and demolition areas of the felled tower, soil will be sampled for the above parameters from 33 locations from a 25 foot grid north of the former tower location. This grid includes the impact and demolition areas in red and green respectively on Figure 1. This area was identified by the Army field representative as the impact and demolition area and represents the general extent of the paint chip observations. If a sample on the edge of either grid exceeds the SSLs another sample will be taken 15 feet outside the sample along the bearing of the grid line or diagonally at a corner. Sample identification nomenclature will be in accordance with FWDA standards as shown in Figure 1. Sampling will be performed in accordance with section 4.4 of the *RCRA Facility Investigation Work Plan (Final)*, dated May 10, 2012 which was approved with modifications by NMED on July 26, 2012 with the following modifications:

Modifications to the 2012 work plan:

- All samples will be taken at 0-2" below the surface which represents the surface soil at FWDA most likely impacted by paint from both structures.
- Sampling devices may include shovels, post hole diggers, scoops, trowels, or similar. Any non disposable sample devices will be decontaminated between uses.
- Duplicate samples will be obtained at a rate of 1 duplicate for each 10 samples.
- MS/MSD samples will be collected according to laboratory requirements.
- Laboratory supplied certified pre-cleaned sample containers will be used.

Soil Removal Technical Approach. Soils exceeding the NMED residential 2012 SSLs will be characterized and disposed in accordance with all local, state, and federal regulations as part of a contract modification to the Eastern Landfill removal contract performed by AMEC. Reference the *Investigation and Remediation Work Plan, Parcel 18, Eastern Landfill Final Work Plan, Revision 1*, dated January 25, 2013. The soil removal will be based on the grid layout. The removal criteria will be based on NMED's *Risk Assessment Guidance for Investigations and Remediation, Volume I*, February 2012 (updated June 2012).

Soil concentrations will be compared to the 2012 NMED SSLs and the additive effects of multiple contaminants, when present, will be taken into account. Since three of the constituents of concern (COCs) are metals the background concentrations may be taken into account. Therefore the Army may calculate the relative contributions of background values to total risk if the additive effects of the metals cause a sample result to exceed the SSLs. The chromium background level was not speciated between chromium III and VI, so the chromium III levels will be compared to background. Chromium VI values will not be compared to background.

If results from a sample exceed the 2012 SSL (or additive amount) for any of the constituents tested, then a square box eight feet (or 12 feet in the demolition area) on every side of the exceedance will be removed to a depth of 0.5' below the surface. The alignment of the 16' x 16' (or 24' x 24') box will be based on the grid layout. This removal area represents the distance half way to the nearest 'clean' sample point. If an exceedance occurs on the edge of the grid, then the eight (or 12) foot distance will go beyond the grid. Once the soil is removed another sample will be taken at the original location and tested for the parameter(s) that exceed the SSL. If there is another exceedance, then another 0.5' will be removed and another test obtained. Results from re-sampling occurrences will have a 3-day lab turnaround. Sampling and removal will cease when sample results are below the SSLs.

Soil will be removed from the grid (as defined by the 4 surrounding sample points) containing the lead result of 974 mg/kg after the new samples are taken and the results are evaluated against the SSLs.

The reporting for this project will be included in the Parcel 13 RFI report. The Army plans to obtain the samples in early 2013 pending EPA approval of this work plan and therefore is requesting a quick review if possible. If you have questions or require further information, please call me at 330-358-7312.

Sincerely,

Mark Patterson
BRAC Environmental Coordinator

Chuck,

A question on the PCB SSLs. We plan to use the individual congener SSLs for PCBs. NMED approved this in the HWMU work plan. Is this table ok with you? Sequester is not looking good for us in Ft. Worth, but still many unknowns.

Steve

Hey Chuck,

We decided to take Cr VI levels in all the samples from the beginning per your comment. We think this will eliminate delays in the field too. I have a question for you in the document. Did some wordsmithing too. If you are ok with this, I'll ask Mark to send formally. Thanks.

Steve

Steve, et al:

The sampling plan revisions look pretty good. I have one change, related to chromium: Page 3: "Once the soil is removed another sample will be taken at the original location and tested for the parameter(s) that exceed the SSL." For chromium, you are testing for CrIII only, not CrVI. I have no problem with that, considering that CrVI is apparently difficult to properly sample and analyze. But CrVI has a very low SSL; CrVI could exceed its SSL while CrIII does not. So elevated CrIII levels indicate potential for CrVI exceedences. If a parameter which exceeds the SSL at a location is one of the three COC metals, please analyze the post-excavation sample for all of these metals and evaluate whether CrVI sampling should be done.

Hey Chuck,

We revised the work plan per your comments and I'm including a redline strikeout version and new figure. Can you review them soon and provide comments? Once you are ok with the e-copy we will formally submit them.

Thanks!
Steve

From: Hendrickson.Charles@epamail.epa.gov [<mailto:Hendrickson.Charles@epamail.epa.gov>]
Sent: Monday, February 11, 2013 4:13 PM
To: Patterson, Mark C Mr CIV USA OSA
Cc: Smith, Steve W SWF
Subject: RE: Wingate Water Towers

Mark & Steve,

Here are my comments on this letter work plan:

- 1) Sampling Technical Approach: "Soil will be sampled for cadmium, chromium (total),..." NMED's SSL table does not list total chromium, listing instead their SSLs for the valence states of chromium III and chromium VI. EPA's Regional Screening Levels (RSLs) for chromium are listed similarly, with no soil RSL

for total chromium. Without doing species-specific sampling and analysis, the only practical method that I know of for handling this is using a rule-of-thumb which assumes that the chromium VI to chromium III ratio is 1:6 in the total chromium results.

2) Page 2: "Since three of the constituents of concern (COCs) are metals the background concentrations must be taken into account. Therefore the Army proposes deducting the 95 upper tolerance limit background concentration (based on the approved 2009 Report) from each metal concentration prior to computing the additive risk." Receptors are exposed to the total amounts of the constituents, not only to the added contamination; SSLs, against which the results will be compared, are based on this total exposure. Do not deduct the background concentrations from the risk calculations. If you wish, you may calculate the relative contributions of background values to total risk and present the results in the sampling report.

3) The existing soil sampling data give a general indication of where contamination exists. But this sampling plan has a fixed, presumptive grid of sampling locations with no provision for further sampling, if needed, to determine the lateral extent of contamination beyond the presumptive grid. Please add provisions for determining the lateral extent of contamination exceeding the risk-based levels.

4) The Daily Field Activity Reports in the January 21, 2013, Water Tower Demolition Report show that the area around the water tower was policed for paint chips on 26 work days. This indicates to me that the area contaminated by lead-based paint is rather extensive, larger than the proposed sampling area. Information from the crew that policed the area may be useful in delineating a general area of paint chip extent upon which to base the sampling area.

5) Figure 1: The impact of the water tower tank on the ground would have dislodged a significant amount of lead-based paint from the tank unless the paint was in good condition, which is unlikely. I note that no soil samples were taken in the impact area during the Phase 1 sampling. Soil samples should be taken here to evaluate releases due to the demolition operation.

Hi Chuck,

Attached is a letter work plan for the testing and removal of any contaminated soils in the area of the former Fort Wingate water tanks in Parcel 13. Please send any comments to Steve and me or give us a call if you want to discuss the plan. NMED will receive a courtesy copy but will not be commenting on it. We would greatly appreciate any help you can give in reviewing the plan as soon as possible as we are trying to coordinate any soil removal at the tanks with the removal of the eastern landfill in parcel 18 this spring. The original copy is being sent to you by FedEx (airbill attached).

Thanks

Ah, good. That information alleviates my concern.

Thank you.
Chuck

Chuck,

We checked with our contractor and they gave the response to your question below.

Water is added to the soil and ECOBOND(r) during mixing. We utilize dust suppression water and this is typically adequate to ensure thorough moisture to ensure dissolution of the ECOBOND(r). The contractor guarantees treatment results meet the treatment criteria (specified by the landfill facility) based on confirmation sampling/analyses of samples collected in the field after treatment.

Steve

All,

Stabilization of the lead (Pb) before disposal is a good thing to do. But I do have a concern with part of the in-situ soil treatment described: the treatment amendments are added as dry product and mixed into the soils, but no water is added to the mix. Such a mixture may pass TCLP tests because the mineralization reactions occur during the test procedure. But dry, treated soil will still contain Pb in its original state until there is enough soil moisture to allow the reactions to occur. And landfills are designed to preclude moisture percolation. My question is this: how does the treatment process assure that the Pb stabilization occurs?

Chuck Hendrickson

Subject: Fort Wingate - Parcel 13 - Water Tower (UNCLASSIFIED)

Classification: UNCLASSIFIED

Caveats: NONE

All,

Good Afternoon, I am a new project manager working on the Fort Wingate closure team. One of the sites I am coordinating is Parcel 13. The Army had previously discussed providing the Parcel 13 RFI report complete with information on the water tower removal. At this time the Army would like to submit the Water Tower removal as a separate document due to issues we are encountering.

The Army discovered during the removal process for the water tower that the TCLP for lead exceeded the criterion and is now a hazardous waste. The army would like to stabilize the soils using a commercial product like those attached to this e-mail. A bench scale test would be done to ensure the stabilization works before using it at the site. The results will be provided to NMED. If the soil does not fail TCLP after stabilization, it would be disposed of as nonhazardous waste. The Army would like to know if NMED and/or USEPA is ok with this approach prior to modifying our contract.

If you have any other questions please feel free to contact me directly.

Thanks,

-Greg
