MEMORANDUM FOR COMMANDER, TOOELE ARMY DEPOT ACTIVITY (TEAD), ATTN: SIOTE-IRE
(MR. LARRY FISHER), BLDG T-8, TOOELE, UT 84074-5000

SUBJECT: Interim Stabilization of Debris Piles at Fort Wingate Depot Activity

1. Reference SAB and letter from New Mexico Environment Department (NMED) dated 23 September 1997, subject: U.S. Army Ft. Wingate Depot Debris Piles/Burial Sites and OB/OD Site Visit.
2. Enclosed is a plan presenting the strategy for stabilizing and maintaining areas at the Central Landfill, the Group C Disposal Area, and the OB/OD Areas to minimize movement of refuse into watercourses due to erosion caused by storm water events as requested in the referenced letter. The plan should be forwarded to the NMED Surface Water Quality Bureau no later than 29 October 1997, in order to meet the response target date of 30 days after receipt of the letter. Please note that implementation of the plan will require purchase of hay bales and labor associated with emplacement of the bales, regular inspection, and picking up debris which has been moved downstream from its original location within the debris piles. Implementation of the plan in the OB/OD Areas will require coordination with the Corps of Engineers, Huntsville Division.
3. Additionally, three maps have been prepared as requested by the NMED Surface Water Quality Bureau during a site visit on 16 September 1997, showing areas of concern (AOCs), site topography, and surface water drainage areas.
4. Storm water sampling data from the Corps of Engineers, Albuquerque District, are also provided for forwarding to NMED Surface Water Quality Bureau. Questions regarding storm water sampling should be directed to Mr. David Gregory, telephone (505) 342-3478.
5. If there are questions about the landfills and interim stabilization prior to final remediation, please contact Mr. Dwayne Ford of our Environmental Design Branch, telephone 817/978-9924, EXT 1644.

FOR THE COMMANDER:

3 Encls

1. Interim Stabilization Plan
2. Drawings (7)
3. Storm Water Data

**Interim Stabilization for Investigated Areas
In or Near Watercourses
Fort Wingate Depot Activity
24 October 1997**

The following paragraphs specify measures to be utilized at Fort Wingate Depot Activity to minimize movement of refuse into watercourses due to erosion caused by storm water events. The measures will be implemented at areas where debris or refuse is present within an arroyo or watercourse or has the potential for migrating into a watercourse. These measures are intended to provide interim stabilization in these areas until final remedial actions at the areas are initiated and the requirements of 20 NMAC 6.2 are fully satisfied. The measures defined here have been established as "performance-based" (e.g., rather than showing specific, detailed measures) to allow the utilization of best professional judgment during field construction and installation.

A number of erosion control measures are available which satisfy the guidelines specified in the EPA document "Storm Water Management for Construction Activities", EPA-832-R-92-005, including silt fences, staked hay bales, diversion dikes, check dams, berms, and sediment traps. Consultation with Mr. Phil Wright of the McKinley County Conservation District indicates that hay bales and/or rock placement were used by the conservation district as Best Management Practices (BMPs), with rock placement used in more permanent applications. Due to considerations for unexploded ordnance and the free roaming buffalo herd at FWDA, it appears the most readily implemented BMPs include removal of materials which have already migrated into a watercourse followed by use of hay bales to mitigate further movement of refuse into watercourses due to erosion caused by storm events. Rock check dams will be used in areas unsuitable for hay bales. Additional or more rigorous techniques will be implemented should the measures currently specified prove ineffective.

Group C Disposal Area - Disposal Area 1 at the Group C Disposal Area does not contain materials requiring stabilization; therefore, no immediate measures are currently proposed. In Disposal Area 2, visible waste materials (fuze cans, banding, etc.) which have migrated from the disposal area downstream will be picked up and placed in bags for proper disposal or, if the waste is not amenable to ready disposal, such as construction debris, it will be reconsolidated at the disposal area in a location and method which minimizes the possibility of future migration. As shown on Figure 1, new hay bales will be installed on existing metal posts along the arroyo bank toe of slope. In order to slow the flow in the channel, thereby minimizing erosion and exposure of subsurface debris in the bottom of the arroyo, three rock check dams will be constructed and placed at the locations shown in Figure 1. Because the area to the north of the arroyo bank is well-vegetated and flat, no measures should be required at the top of slope to redirect storm water run on.

THE UNIVERSITY OF CHICAGO
DEPARTMENT OF CHEMISTRY
RESEARCH REPORT

The following is a summary of the work done in the Department of Chemistry during the year 1954. The work was carried out by the following members of the Department: [List of names]

The first part of the report deals with the study of the reaction of [Chemical] with [Chemical]. It was found that the reaction proceeds through a series of steps, and the rate of reaction is dependent on the concentration of [Chemical]. The activation energy for the reaction was determined to be [Value] kcal/mole.

The second part of the report describes the synthesis of [Chemical] from [Chemical] and [Chemical]. The yield of the product was found to be [Value]%. The product was characterized by its melting point, [Value]°C, and its infrared spectrum.

The third part of the report deals with the study of the reaction of [Chemical] with [Chemical]. It was found that the reaction proceeds through a series of steps, and the rate of reaction is dependent on the concentration of [Chemical]. The activation energy for the reaction was determined to be [Value] kcal/mole.

The fourth part of the report describes the synthesis of [Chemical] from [Chemical] and [Chemical]. The yield of the product was found to be [Value]%. The product was characterized by its melting point, [Value]°C, and its infrared spectrum.

The fifth part of the report deals with the study of the reaction of [Chemical] with [Chemical]. It was found that the reaction proceeds through a series of steps, and the rate of reaction is dependent on the concentration of [Chemical]. The activation energy for the reaction was determined to be [Value] kcal/mole.

The sixth part of the report describes the synthesis of [Chemical] from [Chemical] and [Chemical]. The yield of the product was found to be [Value]%. The product was characterized by its melting point, [Value]°C, and its infrared spectrum.

The seventh part of the report deals with the study of the reaction of [Chemical] with [Chemical]. It was found that the reaction proceeds through a series of steps, and the rate of reaction is dependent on the concentration of [Chemical]. The activation energy for the reaction was determined to be [Value] kcal/mole.

The eighth part of the report describes the synthesis of [Chemical] from [Chemical] and [Chemical]. The yield of the product was found to be [Value]%. The product was characterized by its melting point, [Value]°C, and its infrared spectrum.

The ninth part of the report deals with the study of the reaction of [Chemical] with [Chemical]. It was found that the reaction proceeds through a series of steps, and the rate of reaction is dependent on the concentration of [Chemical]. The activation energy for the reaction was determined to be [Value] kcal/mole.

The tenth part of the report describes the synthesis of [Chemical] from [Chemical] and [Chemical]. The yield of the product was found to be [Value]%. The product was characterized by its melting point, [Value]°C, and its infrared spectrum.

Central Landfill - The Central Landfill is located in an abandoned arroyo adjacent to an active arroyo. The landfill area is well vegetated and most debris is buried under a 2 - 3 foot layer of soil. Except for storm water run on from the railroad culvert at the northwest end of the landfill at its confluence with the active arroyo, minimal water transport occurs through the Central Landfill area. At the confluence with the active arroyo, material in the landfill can be exposed and migrate from the 'face' of the landfill into the active arroyo. Hay bales placed at the confluence with the active arroyo in 1996 following the site investigation will be replaced as shown on Figure 2. Hay bales will also be placed at the location where storm drainage enters the Central Landfill to slow it down without affecting the ability of the existing culvert to convey drainage. Debris which has migrated into the active arroyo will be picked up and bagged for proper disposal or reconsolidated at the Central Landfill in an area where remigration is unlikely.

Western Landfill - The Western Landfill is not located in or proximal to a watercourse. The landfill material is buried and the area is well vegetated with no evidence of erosion or channeling by surface water. Interim measures at the Western Landfill are not required prior to final remediation and closure of the landfill.

Current and Closed OB/OD Areas - The Current and Closed OB/OD Areas contain several areas where debris is located within or adjacent to an arroyo. While much of the material is buried within the banks above the arroyos, there are areas where debris is exposed or can slough from the bank into the arroyo. Visible waste materials (fuze cans, banding, etc.) which have moved from the arroyo bank downstream will be picked up and removed for proper disposal or replaced within the debris piles in such a manner to minimize the likelihood for future migration. Hay bales will be installed/reinstalled at the toe of arroyo banks where there are exposed wastes/debris with the potential to move into a watercourse due to erosion caused by storm water events. Hay bales will also be installed at the top of the arroyo banks at selected locations as necessary to minimize storm water run on. Maps showing the drainage courses and areas of observed wastes/debris are included as Figures 3 and 4. No specific locations for BMP installation have been shown. Field personnel will use their best professional judgment in placement. At the OB/OD Areas, consideration of unexploded ordnance is of paramount importance and any activities, including picking up downstream debris or the driving of stakes for hay bales must be subordinate to UXO safety requirements.

Inspection and Maintenance -

Best management practices implemented at FWDA will be inspected following each rainfall event of 0.5 inches or more. At a minimum, the sites will be inspected every 30 days. Inspection will be performed by on-site personnel, either a Corps of Engineers representative or by the resident FWDA caretakers. Routine maintenance, such as replacing deteriorated hay bales, will be performed as required by the inspector.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions. It emphasizes that every entry should be supported by a valid receipt or invoice. This ensures transparency and allows for easy verification of the data. The text also mentions that regular audits are necessary to identify any discrepancies or errors in the accounting process.

2. The second section focuses on the classification of expenses. It details how different types of costs should be categorized, such as direct costs versus indirect costs, and fixed costs versus variable costs. This classification is crucial for determining the true cost of production and for setting appropriate prices for the goods or services offered. The document also provides examples of how these costs are allocated to different departments or projects.

3. The third part of the document addresses the issue of budgeting. It explains how a budget can be used as a tool to plan and control the organization's financial resources. The text describes the process of setting a budget, monitoring actual performance against the budget, and making adjustments as needed. It also discusses the importance of having a contingency plan in case of unexpected events that could impact the budget.

4. The final section discusses the role of management in the financial process. It highlights the need for clear communication and collaboration between different departments to ensure that financial goals are met. The text also mentions the importance of staying up-to-date on changes in tax laws and other regulations that could affect the organization's financial position.

Tooele Army Depot will be notified in the event major maintenance actions are required. Inspection personnel will also be responsible for identifying the need for additional or alternative BMPs.

Future FWDA Projects

The Central Landfill and Group C Disposal Area are scheduled for remedial actions consisting of excavation and proper disposal of the landfill contents. Prior to the start of excavation at these landfills, a Storm Water Pollution Prevention Plan will be prepared in accordance with EPA-832-R-92-005 Storm Water Management for Construction Activities and a Notice of Intent will be submitted under the National Pollutant Discharge Elimination System. Stabilization of the sites during excavation will be specified in the Storm Water Pollution Prevention Plan.

Should future environmental investigations be performed at FWDA in areas where debris or refuse is present in a watercourse or could migrate into a watercourse, BMPs will be implemented at those sites to minimize negative effects on surface water quality, both during the investigation and in the interim prior to permanent stabilization. Except while work is actively being conducted at a site, staging of equipment, supplies, or investigative-derived wastes (IDW) within a watercourse will not be performed.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions and activities. It emphasizes that this is essential for ensuring transparency and accountability in the organization's operations.

2. The second part of the document outlines the various methods and tools used to collect and analyze data. It highlights the need for consistent and reliable data collection processes to ensure the validity of the findings.

3. The third part of the document describes the results of the data analysis and the conclusions drawn from the findings. It notes that the data indicates a clear trend towards improved performance and efficiency in the organization's operations.
